## Opening Statement

CHAIRMAN FRANCIS: Good morning, everyone.

I'm Bob Francis. I'm vice chairman of the NTSB, and I'm chairing this hearing.

As you know, this is a hearing -- public hearing which is part of our process on an aircraft accident on August 6th, 1997, in Agana, Guam involving Korean Air Flight 801.

The purpose of the hearing is to supplement the factual record of this accident investigation for the NTSB. We thus have the NTSB witnesses, we have party witnesses, and we have some outside witnesses. All of these people have technical expertise to be able to bring to the factual portion of this investigation.

This hearing will not deal, I repeat, will not deal with any analysis of what happened nor will it deal with any causal issues. This is a factual hearing not dealing with analysis or cause.

There are five issues about which we'll be talking here today. The first is controlled-flight-into-terrain accidents and efforts on the part of the aviation community to deal with the controlled-flight-

1     into-terrain accidents.

2             The second is operation of navigational  
3     devices at the Guam airport.

4             The third is Minimum Safe Altitude Warning  
5     systems and practices related to this system at Guam  
6     and nationwide.

7             Fourth, rescue and recovery operations.

8             And fifth, governmental oversight of foreign  
9     air carriers operating into the United States.

10            Before I proceed further I'd like to  
11     introduce three people who are here. First is the  
12     congressman from Guam, Congressman Underwood, who is  
13     sitting over here at our observer table. Second, a  
14     member of the National Transportation Safety Board,  
15     John Hammerschmidt, and third, a colleague and member  
16     also, George Black. They're all sitting over here.

17            I'd like to take a minute and talk about  
18     controlled-flight-into-terrain. Controlled-flight-  
19     into-terrain or CFIT as it is called in the industry is  
20     the major killer of people on a worldwide basis in  
21     commercial aviation. This has been the case for some  
22     time, and there are no indications statistically that  
23     it is not continuing to be the case. It's an  
24     enormously, enormously important issue for those of us  
25     who are involved in the aviation safety business to be

1 dealing with, and it's something that I personally  
2 spend a great deal of my time working on and something  
3 that the industry I think is more and more focusing on  
4 as one of the real places where we can make gains in  
5 safety.

6           So, we'll be talking here about a number of  
7 issues that relate to controlled-flight-into-terrain.  
8 These include issues that can be dealt with by  
9 airlines, by air traffic control authorities, by  
10 equipment manufacturers. There are -- the entire  
11 community can be involved in this.

12           And I'd like to mention that the Flight  
13 Safety Foundation and a large portion of the  
14 international community have over the past five years  
15 or so been doing some very good work in this area.  
16 There's an educational package that's come out that's  
17 being distributed worldwide to airlines which is the  
18 kind of work that hopefully will be done by the  
19 community internationally and voluntarily to try to  
20 deal with this issue. But it's the kind of thing that  
21 -- that allows us to make gains in an area -- this  
22 particular area that's so important.

23           So, I think that -- that we should be  
24 focusing on this. We will be focusing on air traffic  
25 control, we will be focusing on training, we will be

1 focusing on airline cultures, we will be focusing on  
2 new technology which will hopefully let us deal with  
3 this issue. But I personally think that this is  
4 enormously important, and -- and I'm delighted that  
5 we're going to be spending so much time on it.

6 Let me conclude by one note here. We've had  
7 some confusion I think in communications in terms of  
8 dealing with the families and some of the people who  
9 were -- were survivors of the aircraft, and I think  
10 that we're going to make an effort to -- to do a better  
11 job with this communication. I'm going to meet with  
12 the families after -- after this meeting, and we will  
13 be giving them information on how they can communicate  
14 with us more directly because we have had some problems  
15 in the past and -- and I'm sorry that that was the  
16 case.

17 Let me now introduce Ron Schleede, who is the  
18 hearing officer, and he will introduce a number of the  
19 people who are going to be key to this hearing.

20 Introduction of the Board of Inquiry

21 MR. SCHLEEDE: Thank you, Mr. Chairman.  
22 Thank you.

23 My name is Ron Schleede. I'm a deputy  
24 director, Office of Aviation Safety for International  
25 Affairs.

1           The Board of Inquiry up here, I have with me  
2     Mr. Monty Montgomery, chief of our Information  
3     Technology Division, Office of Research and  
4     Engineering.

5           To my far right, that's Mr. Pat Cariseo,  
6     safety specialist in the Office of Safety  
7     Recommendations.

8           To his left is Mr. Ben Berman, chief,  
9     Operational Factors Division.

10          There's other NTSB staff here today sitting  
11     in that location and this location. First, we have  
12     John Clark, deputy director of Office of Aviation  
13     Safety for Investigations and Technical Matters.

14          We have three public affairs officers here.  
15     Mr. Paul Schlamm, Keith Holloway, and Ted Lopatkiewicz.

16          The report-writer for this case, Mr. Gerard  
17     Stichen.

18          Behind us we have Ms. Denise Daniels, special  
19     counsel to the vice chairman; Ms. Maria Sturniolo,  
20     confidential assistant to the vice chairman; and David  
21     Bass, chief counsel -- or deputy chief counsel for the  
22     NTSB.

23          From our Office of Government Affairs we have  
24     Ms. Betty Scott. From the Office of Family Affairs,  
25     Elizabeth Cotham and Matt Furman. We also have Ms.

1 Alice Park with us today from the NTSB Office of  
2 Research and Engineering. She is providing  
3 interpreting services for us.

4 For administrative matters and logistics  
5 regarding this hearing, we have three people seated  
6 over here to the left, Ms. Carolyn Dargan, Candi  
7 Wiseman, and Ann -- I forget the last name. Sorry,  
8 Ann.

9 All these people are available to assist  
10 during any part of the hearing. If you have questions  
11 please approach one of them.

12 Introduction of the Parties to the Hearing

13 MR. SCHLEEDE: I'd like now to switch to the  
14 people in front of us and ask the party spokesman, as I  
15 call each party, to identify their -- their name and  
16 their title, beginning with the Federal Aviation  
17 Administration.

18 MR. DONNER: Yeah, Mr. Chairman, my name is  
19 Bud Donner. I'm the manager of the Accident  
20 Investigation Division, Federal Aviation  
21 Administration.

22 MR. SCHLEEDE: Thank you.

23 Boeing Commercial Airplane Company?

24 MR. DARCY: The name is Kevin Darcy, and I'm  
25 chief investigator, Air Safety Investigation.

1 MR. SCHLEEDE: Thank you.

2 Korean Air Company, Limited?

3 CAPTAIN KIM: Sang Rok Kim, deputy director,  
4 Safety and Security Department.

5 MR. SCHLEEDE: Thank you, Captain Kim.

6 National Air Traffic Controllers Association?

7 MR. MOTE: Good morning, Mr. Schleede and Mr.  
8 Chairman. My name is Charles R. Mote. I'm a senior  
9 safety investigator with NATCA and air traffic control  
10 specialist.

11 MR. SCHLEEDE: Barton ATC International?

12 MR. E. MONTGOMERY: Good morning. My name is  
13 Ed Montgomery. I'm the president of Barton ATC.

14 MR. SCHLEEDE: And the Government of Guam?

15 MR. DERVISH: Good morning. My name is Ron  
16 Dervish. I'm the deputy chief of police, Guam Police  
17 Department and spokesman for the Government of Guam.

18 MR. SCHLEEDE: Thank you, Mr. Dervish.

19 And now I'd like to turn to the Civil  
20 Aviation Bureau of Korea spokesman, please. Please  
21 state your name and title.

22 MR. LEE: (responds in Korean)

23 MR. SCHLEEDE: And also at that table is Mr.  
24 Ham, who is the designated accredited representative  
25 for the Government of -- of Korea during the on-scene

1 investigation.

2 I'd like to mention that the KCAB is  
3 representing the Government of Korea as part of this  
4 investigation in accordance with the provisions of the  
5 convention on International Civil Aviation and Annex 13  
6 to that convention. Annex 13 provides certain rights  
7 and obligations on the state of registry of an airline  
8 when it crashes in another country. This investigation  
9 has been conducted in full compliance with the spirit  
10 of cooperation intended by Annex 13. I want to thank  
11 publicly our colleagues from the KCAB for their  
12 assistance in this investigation.

13 Introduction of the Technical Panel

14 MR. SCHLEEDE: The Board of Inquiry will be  
15 assisted by a Technical Panel of specialists from the  
16 NTSB, led by Mr. Greg Feith, the investigator-in-  
17 charge. I'd like Mr. Feith to now introduce the  
18 Technical Panel.

19 MR. FEITH: Thank you, Mr. Schleede.

20 With us at the Technica Panel is Mr. Charles  
21 Pereira. He is an aircraft performance specialist in  
22 the Office of Research and Engineering. He did the  
23 aircraft performance study for this accident.

24 Sitting to his left is Mr. Scott Dunham. He  
25 is a air traffic control specialist in the Office of

1 Aviation Safety.

2 Sitting next to Mr. Dunham is Mr. Richard  
3 Wentworth. He is a national resource specialist for  
4 air traffic control in the Office of Aviation Safety,  
5 both of whom have done extensive work on this  
6 investigation.

7 At our back table sitting directly behind me  
8 is Mr. Paul Misencik, Captain Misencik. He was the  
9 operations group chairman for this investigation.

10 Sitting to his left is Mr. Malcolm Brenner --  
11 Dr. Malcolm Brenner, who did the human performance  
12 aspect of the investigation in conjunction with the  
13 operations group.

14 Sitting next to Dr. Brenner is Mr. Greg  
15 Phillips. He did the aircraft systems portion of the  
16 investigation and also did the aircraft structures.  
17 Our aircraft structures specialist is not present  
18 today, and so, Greg will discuss any structural  
19 questions if they do arise.

20 And then sitting next to Mr. Phillips is Mr.  
21 Gary Hammack, and he will be addressing the crash/fire  
22 or search/fire/rescue aspects of this investigation.

23 CHAIRMAN FRANCIS: Let me introduce one other  
24 extraordinarily important person here, Teddy Brown, who  
25 makes certain that we can all communicate one with

1 another in this room. He works for us with the NTSB in  
2 Washington.

3 Now I'd ask Greg Feith, the investigator-in-  
4 charge, he's got a prepared statement to come as -- as  
5 the first witness.

6 Description of the Investigation by Mr. Feith

7 MR. FEITH: Good morning, Mr. Chairman, Board  
8 of Inquiry, colleagues on the Technical Panel, parties,  
9 ladies and gentlemen.

10 On August 6th, 1997, about 01:42 Guam time a  
11 Korean-registered Boeing 747-300 operated by Korean Air  
12 Company, Limited as Korean Air Flight 801 crashed about  
13 three nautical miles southwest of the Guam  
14 International Airport in Agana, Guam while executing  
15 the ILS approach or Instrument Landing Systems approach  
16 to runway 6-left.

17 The Safety Board was notified of this  
18 accident on August 5th about 12 noon Eastern Daylight  
19 time. I was assigned as the investigator-in-charge.  
20 The go-team assembled at Andrews Air Force Base in  
21 Maryland and departed later that evening via United  
22 States Air Force C141 transport aircraft to Fairchild  
23 Air Force Base in Washington state. The trip to Guam  
24 was subsequently completed on a KC 135R, and the team  
25 arrived in Guam about 8:30 in the morning Guam time on

1 August 7th.

2 The Board member on duty at the time was  
3 George Black, and he accompanied the team to the crash  
4 site.

5 The investigative team consisted of various  
6 specialists from the Safety Board's headquarters, the  
7 south central region, and southwestern regional  
8 offices. The specialty areas were aircraft operations,  
9 human performance, aircraft systems, structures, power  
10 plants, maintenance records, air traffic control,  
11 survival factors, aircraft performance, meteorology,  
12 and search/fire/rescue. There were also specialists  
13 assigned to conduct the read-out of the flight data  
14 recorder and to transcribe the cockpit voice recorder  
15 in the Safety Board's laboratory in Washington, D.C.

16 With regard to the CVR, the initial CVR --  
17 transcript was produced in English by the initial group  
18 members that convened in Washington. The CVR group  
19 then later reconvened and produced a more --

20 CHAIRMAN FRANCIS: Greg -- Greg, what we're  
21 doing in simultaneous interpretation here so you're  
22 going to have to go a little slower --

23 MR. FEITH: Okay.

24 CHAIRMAN FRANCIS: -- those ladies back there  
25 are going to be in trouble.

1           MR. FEITH: Okay. The initial CVR transcript  
2 was produced in English by the group. However, the CVR  
3 then reconvened and produced a more detailed and -- and  
4 detailed transcript in both English and Korean  
5 languages.

6           The following organizations were given party  
7 status and provided technical assistance to the Board:  
8 the Federal Aviation Administration; Korean Air  
9 Company, Limited; Boeing Commercial Airplane Company;  
10 Pratt-Whitney Engines; the National Air Traffic  
11 Controllers Association; the United States Navy; and  
12 emergency response personnel from Guam.

13           In addition, Mr. Ham of the Korean Civil  
14 Aviation Bureau was designated as the accredited  
15 representative and the leader of the Korean delegation  
16 in accordance with the provisions of Annex 13 to the  
17 Convention on International Civil Aviation.

18           Further, two air safety investigators from  
19 the Australian Bureau of Air Safety Investigations, or  
20 BASI as they're more commonly known, participated in  
21 the investigation as technical observers.

22           Now, to give you a brief history of flight.  
23 Korean Air Flight 801 was a regularly scheduled  
24 passenger flight that departed Kimpo Airport in Seoul,  
25 Korea at 21:53 or approximately 9:53 in the evening.

1 The -- the flight itself proceeded uneventfully en  
2 route to Guam. An audio examination of the CVR  
3 revealed that the captain was what we call the flying  
4 pilot and that the first officer was performing the  
5 radio communications and those duties required of the  
6 non-flying pilot at the time of the accident.

7 At 01:03 the first officer contacted the Guam  
8 Air Traffic Control Center and Radar Approach Control,  
9 or more commonly known as CERAP, and stated that they  
10 were at flight level 410 or 41,000 feet over Nimitz  
11 Intersection, which is a reference point -- a  
12 navigation reference point located about 240 nautical  
13 miles northwest of the VOR -- Nimitz VOR which is in  
14 close proximity to Guam International Airport.

15 About 01:11:51 the CVR recorded the captain  
16 briefing the other flight crew members about the  
17 approach to Guam. The captain stated in part, quote,  
18 "I will give you a short briefing. Since the  
19 visibility is six miles, when we are in visual  
20 approach, as I said before, set the VOR on number two  
21 and maintain the VOR for the top of descent. In the  
22 case of a go-around, since it is VFR while staying  
23 visual and turning to the right request a radar vector.  
24 Since the localizer glide slope is out, the minimum  
25 descent altitude is 560 feet and the height above

1     touchdown is 304 feet."

2             At the conclusion of this briefing, a short  
3     time later at 01:22, the Guam CERAP controller informed  
4     Flight 801 that the Automatic Terminal Information  
5     Service or ATIS report, which is a prerecorded report  
6     of the weather conditions at Guam were as follows:  
7     that the current weather was uniform and that the  
8     current altimeter setting was 29.86.

9             The first officer acknowledged the  
10    transmission and said, "Checking uniform." However, he  
11    did not acknowledge the altimeter setting.

12            About two minutes later Flight 801 began  
13    deviating around cumulo-nimbus clouds that were  
14    scattered along their route of flight. About six  
15    minutes later the first officer reported to the Guam  
16    CERAP controller that they had cleared the weather and  
17    requested radar vectors to runway 6-left.

18            At -- at 01:31 the CERAP controller provided  
19    radar vectors to Flight 801, and approximately seven  
20    minutes later the controller transmitted, quote,  
21    "Korean Air 801 turn left heading 090. Join the  
22    localizer." The first officer acknowledged this  
23    transmission.

24            About eight minutes later the CERAP  
25    controller transmitted, quote, "Korean Air 801 cleared

1     for the ILS runway 6-left. Glide slope unusable." The  
2     first officer responded, "Korean 801, roger. Cleared  
3     ILS runway 6-left." However, the first officer did not  
4     acknowledge the glide slope was unusable.

5             Shortly after being cleared for the ILS  
6     approach, the CVR recorded the flight engineer saying,  
7     quote, "Is the glide slope working?" to which the  
8     captain responded, "Yes, yes. It's working."

9             At 01:39:58 the CVR recorded an unidentified  
10    flight crew member say, "Check the glide slope if  
11    working," followed by "Why is it working?"

12            The first officer responded, quote, "Not  
13    usable."

14            About 23 seconds later, the CVR recorded an  
15    unidentified flight crew member say, "Glide slope is  
16    incorrect."

17            At 01:40 the first officer stated that they  
18    were approaching an altitude of 1400 feet. The captain  
19    responded, quote, "Since today's glide slope condition  
20    is not good we need to maintain 1440. Please set it."

21            Approximately 20 later -- 20 seconds later,  
22    the sound of the altitude alert, which is an alert in  
23    the cockpit with a predetermined altitude set in, was  
24    recorded on the CVR.

1           At 01:41 and 14 seconds, the controller  
2           cleared Flight 801 to land on runway 6-left. The first  
3           officer acknowledged the clearance and the crew began  
4           to reconfigure the airplane for landing.

5           About 01:41 and 42 seconds the CVR recorded  
6           the ground proximity warning announcing 1000 feet and  
7           the captain beginning a checklist item saying, "No  
8           flags, gear, flaps."

9           About four seconds later the captain said,  
10          "Isn't glide slope working?" There was no response to  
11          this statement by the captain.

12          The crew continued to complete the landing  
13          checklist items, and at 01:42 the CVR recorded the  
14          ground proximity warning system announcing, quote,  
15          "Minimums" followed by "sink rate." This announcement  
16          was followed shortly thereafter by the first officer  
17          saying, quote, "Sink rate okay," and the flight  
18          engineer announcing, "200 feet."

19          At 01:42:19 the first officer said, quote,  
20          "Let's make a missed approach," and the flight engineer  
21          said, quote, "Not in sight, missed approach."

22          These two comments were followed immediately  
23          thereafter by both the first officer and the flight  
24          engineer saying, quote, "Go around."

1           Approximately one second later the CVR  
2     recorded the sound of the auto-pilot disconnect chime  
3     and the altitude announcements on the GPWS or Ground  
4     Proximity Warning System.

5           The sound of the airplane ~~in~~ impacting the  
6     ground were recorded by the CVR at 01:42 and 26  
7     seconds.

8           The published -- excuse me. The published  
9     approach procedure for the ILS to runway 6-left with  
10    the glide slope inoperative depicts a series of step-  
11    down altitudes that the pilot is required to maintain  
12    during the execution of the approach. What you will  
13    see is the step-down altitudes which will ensure  
14    sufficient terrain and obstacle clearance.

15           (Slide)

16           MR. FEITH: Unfortunately, I don't have a  
17    pointer, but if you'll look at --

18           (Pause)

19           MR. FEITH: In this box right here is a  
20    profile view of the approach where this being 2600 feet  
21    will be the initial intercept altitude. There is a  
22    step-down to an altitude of 2000 feet with another  
23    step-down to 1440 feet and then a final step-down to  
24    the minimum descent altitude of 560 feet.

1           These step-down altitudes ensure that the  
2 pilot will maintain an obstacle and terrain clearance  
3 during this portion of the approach.

4           (Slide)

5           MR. FEITH: The lowest altitude for the first  
6 segment is 2000 feet until 1.6 nautical miles, so the  
7 aircraft would be at 2000 feet until this point right  
8 here. This would be followed by a step-down to 1440  
9 feet until crossing the VOR.

10          (Slide)

11          MR. FEITH: And then stepping down to the  
12 final MDA of 560 feet.

13          If visual contact with the airport does not  
14 occur within the 2.8 miles after crossing the VOR or  
15 visual contact cannot be made, the pilot must execute a  
16 missed approach.

17          According to the data recorded by the flight  
18 data recorder Flight 801 began to descend from 2600  
19 feet when the airplane was about five miles from the  
20 VOR or about 8.5 miles from the airport. The flight  
21 data recorder and radar data indicated that Flight 801  
22 had been descending at a rate of approximately 950 feet  
23 per minute and continued at this rate through the  
24 intermediate altitudes of 2000 and 1440 feet. The  
25 airplane struck the rising mountainous terrain about

1 one-tenth of a mile west of the VOR.

2 And at this time, Mr. Chairman, I think that  
3 because this is a bit complicated we do have a video  
4 depiction which will show both a plan view and a  
5 profile view of the aircraft as it traversed the  
6 terrain, and this information is based on the flight  
7 data recorder and radar data that was collected during  
8 the course of the on-scene investigation, and I'd like  
9 to show that now.

10 CHAIRMAN FRANCIS: That's very helpful.  
11 Let's do that.

12 (Mr. Feith narrates the scenes from the  
13 video.)

14 MR. FEITH: What we're going to see -- and  
15 this video is approximately 10 minutes long. The first  
16 part of the video itself will be a -- a still or just a  
17 picture of the terrain in the area of Agana Airport in  
18 Guam. And then you will see a profile plan. And what  
19 you have is the terrain looking down on Guam. Here is  
20 Agana, Guam International Airport, runway 6, the  
21 coastline.

22 This is the middle marker, which is one of  
23 the navigational aids that is part of the Instrument  
24 Landing System Approach.

1           This is the VOR that we've been referencing.

2       It sits up on Nimitz Hill, and it is also an integral  
3 part of the Instrument Approach Landing System approach  
4 for this runway. And then the outer marker, which is  
5 also another navigational point for the ILS approach.

6           Flake Intersection is a navigational  
7 reference point at which the airplane will initially  
8 intercept the localizer, which in this case because the  
9 glide slope portion which provides the pilot with a  
10 vertical guidance to the runway was out of service, the  
11 only navigational aid associated with the ILS on this  
12 particular night was the localizer which provides  
13 lateral guidance to the pilots. So, the lateral  
14 guidance would keep it within this -- these two lines  
15       -- this band to the runway.

16           In the profile you see depicted here the  
17 step-down altitudes as they are depicted on the  
18 approach procedure for this runway. And again, this is  
19 a terrain profile. You have nautical miles across the  
20 bottom to the airport. You have altitude in feet above  
21 sea level, not above the ground.

22           And you will see in this animation the  
23 airplane as it begins its trek into the localizer  
24 flight path and then proceeds towards the airport. At  
25 the same time, you will see what it is doing in the

1 vertical and you will watch the airplane as it comes  
2 through the various altitudes on its flight profile all  
3 the way to the impact point.

4 All of this information was derived from  
5 radar data that was accumulated and the flight data  
6 recorder data from the aircraft. So, what you're  
7 seeing is the actual profile of what the airplane did  
8 prior to the accident.

9 The CVR text will be depicted right in the  
10 middle, and what we've done so that you can read it  
11 because it starts to scroll pretty quickly is that  
12 you'll see this played in half-speed so it will not be  
13 real time so that you can read the CVR data. We then  
14 played -- replayed the -- the animation again at  
15 regular speed or full speed so that you will be able to  
16 see it in real time. But you will have had an idea of  
17 what was transpiring in the cockpit with the flight  
18 crew during the -- during the flight path  
19 demonstration.

20 CHAIRMAN FRANCIS: Could -- could we ~~stop~~<sup>top</sup> for  
21 just a second? We're going to show this animation, and  
22 -- and I would just say to those here, particularly  
23 family members, this is not -- this -- this shows the -  
24 - the actual flight of the aircraft. It's possible  
25 that -- that you could find this disturbing, and if you

1 would like we'll leave a second here if you'd like to  
2 go out of the room while we do this.

3 (Pause)

4 CHAIRMAN FRANCIS: Okay. Go ahead.

5 MR. FEITH: You'll see the airplane entering  
6 the picture. And again, this is looking down on the  
7 airplane as the airplane is beginning its intercept of  
8 the localizer. It'll join the localizer and then begin  
9 a trek towards the airport. At the same time the  
10 airplane has entered the picture up here in the left  
11 corner and is tracking along this altitude line of 2600  
12 feet. And as you can see from the note that they will  
13 remain at 2600 feet or should remain at 2600 feet until  
14 passing the Flake intersection, this point right here.

15 And you will see where they intercept, which is just  
16 inside of Flake.

17 (Pause)

18 MR. FEITH: Now, again, because of -- excuse  
19 me. Because of the information that would be necessary  
20 such as you see here for this demonstration, terrain  
21 information is not typically depicted on approach  
22 plates. So, this information has been derived off of  
23 topographic maps and is in pretty much of a -- a direct  
24 relationship to the flight path and its relative  
25 position to the airport. But again, we're talking in

1 an expanded vertical scale so that you can see the  
2 actual movement of the aircraft.

3 And as you can see right here, the airplane  
4 has passed Flake intersection in both views and will  
5 then begin the descent because they've now been cleared  
6 for the ILS approach.

7 (Pause)

8 MR. FEITH: One of the things that we found  
9 during the course of the investigation was that  
10 although the weather conditions were reported as VFR or  
11 visual there were some areas of thunderstorm build-up  
12 around the airport area and included a thunderstorm  
13 build-up off the approach-end of the runway, which the  
14 aircraft did in fact fly into because on the CVR we do  
15 hear the sound of the windshield wipers on the aircraft  
16 being turned on. And so, we know that the aircraft had  
17 flown into a rain event. And I will talk briefly about  
18 that later on.

19 But you see the -- the airplane will now  
20 begin a descent. These are intermediate altitudes of  
21 2000 feet, 1440 feet, and then on down to 560 feet once  
22 the high terrain is cleared, and that would be the  
23 altitude that the aircraft would remain at until the  
24 pilots had a visual cue on the airport and then would  
25 make a normal landing.

1 (Pause)

2 MR. FEITH: Again, they referenced a 1440.  
3 The airplane is on its way down.

4 (Pause)

5 MR. FEITH: Another integral part of this  
6 approach is the VOR, and the reason it is critical is  
7 because the captain would typically fly with his  
8 navigation instruments set for the localizer. So he  
9 would be tracking the lateral guidance while the first  
10 officer would typically be monitoring the distance-  
11 measuring equipment on board that reads off the mileage  
12 from the station digitally. And so, he would be  
13 monitoring the digital countdown because you're  
14 counting down from seven nautical miles at Flake  
15 intersection to zero at the VOR. Then you would --  
16 once passing the VOR would begin your count back up to  
17 2.8 to the runway.

18 As you see, as the airplane continues its  
19 trek now over land the airplane has gone through the  
20 2000-foot altitude and continues on a steady state  
21 descent down to 1440.

22 Typically, the airplane would fly -- now,  
23 this MSAW alert that you just saw flash right here,  
24 this is the Minimum Safe Altitude Warning system that  
25 the FAA has. It is a system that works in conjunction

1 with the radar at this airport and other airports  
2 around the nation, United States.

3 And what we have demonstrated here is that if  
4 the system, which we will talk about and we will have  
5 witnesses addressing later on, had been working as it  
6 was intended, the controllers would have had a Minimum  
7 Safe Altitude Warning alert right here when the  
8 airplane exceeded this 2000-foot step-down at the 1700-  
9 foot level. However, because the system did not work  
10 as designed the controllers did not receive the MSAW  
11 alert and that information was not forwarded to the  
12 crew while they were doing the approach.

13 As you see, the airplane continues in a  
14 steady state descent as it's approaching the outer  
15 marker. And again, it has gone through the  
16 intermediate altitude of 1440 feet.

17 The crew is going through checklist items.  
18 The first officer, which is the Cam-2 position, does  
19 not see the -- what we believe is the runway, says "not  
20 in sight." They're continuing their checklist items.

21 (Pause)

22 MR. FEITH: You can see that the GPS is  
23 starting to call the sink rate and the minimums.  
24 However, the first officer says that the sink rate is  
25 okay.

1           There's the 200-foot call. They don't see  
2           the airport. They're in the process of going around.

3           Disconnect. That is the countdown between  
4           the airplane and -- and ground. And the airplane  
5           impacts the hill in the vicinity of the VOR.

6           (Pause)

7           MR. FEITH: And as you will see now, the --  
8           the real time animation will run at a quite a bit  
9           faster speed.

10          (Pause)

11          MR. FEITH: Okay. Again, you have the  
12          airplane entering the picture, both at altitude and  
13          then over the water as it intercepts the localizer.

14          (Pause)

15          MR. FEITH: Had the glide slope portion of  
16          the ILS been working -- the glide slope projects an  
17          invisible radio beam at about a three degree angle  
18          projected upward, which once the airplane intercepts  
19          that glide slope electronically, the flight crew then  
20          would follow its instruments. As long as the airplane  
21          was on the glide slope it would bring it down to the  
22          runway at a -- at a -- approximately three-degree  
23          angle, which would clear all of this terrain.

24          But because the glide slope was inoperative,  
25          there is a different set of minimums, altitudes that

1 the -- the flight crew must follow, a different set of  
2 procedures, which is this step-down so that they can  
3 systematically fly over this area of high terrain. But  
4 it is critical that these navigational aids be used as  
5 a gauge when crossing this area of high terrain during  
6 the course of the approach.

7 And as I had briefly spoke in the earlier  
8 part of my statement, there was a -- a discussion  
9 amongst the flight crew members about the glide slope.

10 Although the glide slope had been NOTAM'd, and that is  
11 Notice to Air Men. It's a piece of information put out  
12 by the FAA that the glide slope was out of service.  
13 There was still some question by the flight crew as  
14 they were proceeding on the approach about the  
15 operational status of the glide slope. And because of  
16 that, that is one of the issues that the Safety Board  
17 Operations and Human Performance group has looked into  
18 with regard to why the crew would have been questioning  
19 that given the fact that it was in fact inoperative.

20 And you see the MSAW alert flashing. This  
21 would be typically where we would have expected the  
22 controller to have received the MSAW alert that the  
23 airplane had gone through this 2000-foot altitude which  
24 it should have been at, and they would have then  
25 provided a low altitude warning alert to the crew.

1 (Pause)

2 MR. FEITH: A couple other notes about this  
3 particular area. In talking to pilots that fly into  
4 this area quite a bit, especially at night, this is  
5 what we call a -- a black hole. That is, the terrain  
6 around here is such that there are no lights as you  
7 would typically see looking out the window here in  
8 Honolulu with all the lights of the building. To  
9 contrast that, there are very few if any lights in this  
10 area and you cannot really distinguish the terrain from  
11 the black of night, so it looks like a black hole.

12 All of these things are considerations that  
13 the Human Factors and Operations group had to look at  
14 during the course of their investigation, and that is  
15 just parts of their investigative process with -- with  
16 regard to the crew and the operation of this airplane.

17 (End of video)

18 MR. FEITH: Hopefully you have a little  
19 better idea now of what the aircraft was doing. You do  
20 have some sense of what the flight crew was doing at  
21 various times during the course of the approach.

22 The investigation is a very complex process.  
23 There are a lot of aspects that need to be looked at.  
24 And while this public hearing tends to focus on five  
25 of the issues that the chairman has discussed, I'd just

1     like to give you a little bit of information on some of  
2     the other things that -- that we are looking at and  
3     some information that we've revealed thus far during  
4     the course of the investigation.

5             To begin, the captain had been a pilot in the  
6     Korean Air Force prior to his employment with Korean  
7     Air in November 1987. During his tenure with the  
8     airline he flew the Boeing 727 and the Boeing 747. He  
9     had accumulated about 9000 hours of total flight time  
10    with 3000 hours in the Boeing 747 and about 1700 as a  
11    captain in the 747.

12            According to company records the captain had  
13    operated a Boeing 727 into Guam for approximately one  
14    year back in 1993. There were no other records of him  
15    flying into Guam until he received video  
16    familiarization for operations into Guam and a line  
17    experience trip or a line trip into Guam which occurred  
18    on July 4th, 1997. This operation was conducted in a  
19    Boeing 747. It was done at night in VFR conditions.

20            The first officer was also a pilot in the  
21    Korean Air Force prior to his employment with Korean  
22    Air in 1994. He had accumulated about 4000 hours of  
23    total time and about 1500 hours as a first officer in  
24    the 747. The first officer received his  
25    familiarization training for operations into Guam on

1 July 8th, 1997, and had previously operated into Guam  
2 in the 747 back in 1995.

3 The flight engineer had been a navigator in  
4 the Korean Air Force prior to his employment with  
5 Korean Air in May of 1979. He had flown as an engineer  
6 on the Boeing 727, the Air Bus A300, and the Boeing  
7 747. He had approximately 13,000 hours of total flying  
8 time, of which 11,000 was over a period as a civilian  
9 flight engineer.

10 Several issues that we have looked at as the  
11 investigative team include the development of the -- an  
12 issue that was developed during the course of the  
13 investigation evolved from the operational status, as I  
14 mentioned, of the glide slope portion of the Instrument  
15 Landing System. On August 6th the glide slope portion  
16 of the ILS was out of service and only the localizer  
17 was available. Because of the comments that the crew  
18 had made regarding the operational status as you saw  
19 during the course of the animation, the discussion that  
20 they had regarding the operational status of the glide  
21 slope, we became concerned what may have caused them to  
22 have this discussion.

23 One of the aspects that we're looking at is  
24 what we call spurious signals or radio signals that may  
25 have influenced the navigation equipment on the

1 airplane. That is an aspect that our aircraft systems  
2 group is currently looking into.

3 The investigative team also examined the  
4 weather conditions as I had said earlier. At the time  
5 of the accident the reported conditions at the airport  
6 were generally good with light winds from the east.  
7 Visibility was about seven miles in a rain shower, and  
8 there were broken clouds. However, based on data that  
9 we were able to obtain from Doppler radar, from  
10 satellite imaging, and from witnesses, we found that  
11 there was a thunderstorm on the approach end of the  
12 airport at the time that the airplane -- that Flight  
13 801 had been traversing through and that this  
14 thunderstorm was of -- was capable of producing heavy  
15 rain and gusty winds and reduced visibility. We are  
16 also looking at that and -- from an aspect of what that  
17 may have done to influence the crew in their decision-  
18 making.

19 The en route and approach radar positions at  
20 Guam are typically performed by one controller using  
21 two independent radar systems. And as I had mentioned  
22 earlier, that's what we characterize or call the CERAP.

23 Both systems are equipped -- that is, the radar  
24 systems are equipped with a Minimum Safe Altitude  
25 Warning system, as I pointed out, with the alert that

1     you saw in the demonstration and that when the airplane  
2     exceeded the minimum altitudes or a predetermined  
3     altitude the controller would typically get this  
4     warning.

5             We want to know why the system was not  
6     working as it was intended. That is one of the focal  
7     points of this investigation. And we will have  
8     witnesses that will be testifying to this issue later  
9     on in the hearing.

10            The Safety Board also found during the  
11     investigation that the post-accident emergency response  
12     to the accident site was delayed several minutes  
13     because the air traffic -- because the air traffic  
14     controller was not immediately aware that Flight 801  
15     had crashed off the airport.

16            In addition, emergency response vehicles were  
17     delayed in arriving on the scene because access to the  
18     accident site was initially stopped by a fenced gate  
19     around the property where the airplane had crashed and  
20     then further hampered by a narrow paved road which was  
21     blocked by some emergency vehicles that were disabled  
22     thus preventing the fire trucks from getting close --  
23     into close proximity to the accident site itself.

24            Again, we will have witnesses that will be  
25     talking to these issues later on in this hearing.

1           In addition to this, the Safety Board will  
2     also be examining several other issues, including the  
3     crew's training at Korean Airlines, crew resource  
4     management or how the crew works together, and  
5     instrument approach procedures and charting. Is there  
6     a way to look at these approach procedures that the  
7     crew must follow during periods of -- of bad weather or  
8     reduced visibility that will give them better  
9     information so that we will not have what the chairman  
10    has talked about, and that is controlled-flight-into-  
11    terrain type accidents.

12           Although the Safety Board investigative team  
13    completed the on-site wreckage examination August 28th,  
14    1997, several other investigative activities have  
15    either been completed or are ongoing. These in --  
16    activities involve the examination and tear-down of  
17    various electronic components, as I referenced earlier,  
18    the navigation equipment. These activities involve the  
19    study of aircraft performance, the follow-up on the  
20    MSAW system, and of course, the detection of spurious  
21    signals in the area around Guam.

22           In addition to the investigative activities,  
23    a meeting was convened in Guam back in January of 1998  
24    and was attended by all of the parties. The purpose of  
25    this meeting was to review the progress of the

1 investigation thus far, to review all of the reports  
2 that have been produced by the National Transportation  
3 Safety Board group chairman thus far, and then to  
4 determine future work items that are necessary as far  
5 as the investigation process is concerned. Since this  
6 meeting, all of the parties and the KCAB have reviewed  
7 the factual reports and their comments have either been  
8 addressed or incorporated into the respective reports.

9 The issues stated by the chairman in his  
10 opening remarks and those described briefly in this  
11 statement will be addressed by witnesses that were  
12 selected based on their expertise, their extensive  
13 knowledge, or -- excuse me, or their experience as they  
14 relate to the subjects and the issues. Their testimony  
15 will provide additional factual information which the  
16 Safety Board will use in its analysis of this accident  
17 and its determination of the probable cause.

18 And before I conclude, Mr. Chairman, I would  
19 just like to take a moment to publicly thank some  
20 people and some organizations. First, Mr. Ham and the  
21 Korean delegation for their continuing support and  
22 assistance in the investigative process. It's been a -  
23 - a very difficult situation, especially because of the  
24 distance that we need to communicate, but we've been  
25 able to coordinate our activities and our efforts, and

1     it's worked out thus far.

2             I'd also like to thank my colleagues here at  
3     the Board, the investigators that worked very  
4     diligently under very stressful conditions to get the  
5     work done in very short order given the fact that,  
6     unfortunately, we've had numerous accidents of recent  
7     late and we were all pulling double duty.

8             I'd also like to thank the U.S. Air Force for  
9     giving us transport to the accident site and the Navy  
10    for their cooperation and the logistical support while  
11    we were at the accident site.

12            And I'd also like to thank the officials and  
13    the citizens of Guam who extended the team while we  
14    were on-scene for almost a month for their generosity  
15    and their hospitality. We were -- we were treated very  
16    well there, and people pitched in and volunteered a lot  
17    of service to us and we do appreciate them.

18            Mr. Chairman, this concludes my remarks. The  
19    -- the record of investigation is contained in the  
20    documents in our public docket, and the court reporter  
21    has been provided a list of such materials.

22            CHAIRMAN FRANCIS: Thank you, Mr. Feith.

23            We will now go ahead and call our first  
24    witness, who is Mr. Kurt Mayo, approach controller,  
25    FAA, Guam CERAP.

1 Whereupon,

2 KURT MAYO

3 was called as a witness, and first having been duly  
4 sworn, was examined and testified as follows:

5

6 TESTIMONY OF

7 KURT MAYO

8 APPROACH CONTROLLER

9 FEDERAL AVIATION ADMINISTRATION

10 GUAM CERAP

11 MR. SCHLEEDE: Mr. Mayo, please state your  
12 full name and business address for our record.

13 THE WITNESS: My name is Kurt Mayo. My  
14 business address is Guam CERAP, Anderson Air Force  
15 Base, Guam, Building 18011.

16 MR. SCHLEEDE: And by whom are you employed?

17 THE WITNESS: I work for the Federal Aviation  
18 Administration.

19 MR. SCHLEEDE: Okay. And what is your  
20 position at the --

21 THE WITNESS: I'm an air -- I'm an air  
22 traffic control specialist.

23 MR. SCHLEEDE: And how long have you worked  
24 as air traffic specialist?

1 THE WITNESS: 19 and a half years.

2 MR. SCHLEEDE: Could you provide us a brief  
3 summary of your training and experience that qualifies  
4 you for your present position?

5 THE WITNESS: I started my career as an air  
6 traffic controller in 1978 with the United States Navy.

7 I was assigned to the Naval Air Station, Cubie Point  
8 in the Philippines where I was qualified as a full  
9 performance level controller in the radar approach  
10 control as well as the control tower. I was also  
11 qualified as the facility watch supervisor. I worked  
12 there for three and a half years.

13 I began my career with the Federal Aviation  
14 Administration as an air traffic controller in 1982. I  
15 was assigned to the Los Angeles Terminal Radar Approach  
16 Control where I was a full performance level  
17 controller. I worked for the Los Angeles TRACON from  
18 May 1982 until February 1994, at which time we  
19 relocated our office to San Diego, California to the  
20 Southern California Terminal Radar Approach Control.

21 I worked in the Southern California TRACON  
22 from February 1994 until September 1995 in the Los  
23 Angeles area as a full performance level air traffic  
24 controller.

1           In September 1995 I transferred to the Guam  
2   Center Radar Approach Control where I currently work as  
3   a full performance level controller until this day.

4           MR. SCHLEEDE: Thank you very much, Mr. Mayo.  
5   Mr. Wentworth will proceed with the questioning.

6           MR. WENTWORTH: Thank you, Mr. Schleede.  
7           Good morning, Mr. Mayo. Thank you for  
8   coming.

9           THE WITNESS: Good morning.

10          MR. WENTWORTH: Mr. Mayo, are you currently  
11   certified -- medically certified as a controller?

12          THE WITNESS: Yes, sir. Am.

13          MR. WENTWORTH: Okay. Do you have any  
14   waivers or limitations?

15          THE WITNESS: No, sir. I do not.

16          MR. WENTWORTH: And when was your last  
17   medical?

18          THE WITNESS: In December of 1997.

19          MR. WENTWORTH: Thank you.

20          Okay. Teddy, 3D, please?

21          And would you go to 3D also, Mr. Mayo,  
22   please?

23          (Pause)

24          MR. WENTWORTH: And this is a layout of the  
25   radar approach control.

1 (Pause)

2 MR. WENTWORTH: Mr. Mayo, if you'd just look  
3 at the very top of the view there. Would you please  
4 show us where you were operating and would you explain  
5 the radar systems that you had to -- to work with  
6 there?

7 THE WITNESS: I was working at the R4  
8 position here in front of the long-range radar scope.  
9 Directly to my right is the ASR radar scope,  
10 approximately one foot to my right. To my left is the  
11 D3 position where I have the teletype printer, flight  
12 progress strips, and this is the position where I  
13 normally answer land-line calls.

14 MR. WENTWORTH: Okay, sir. And where -- was  
15 the other associate at that particular time you were on  
16 duty? Was he out of the room?

17 THE WITNESS: Yes, sir. He was.

18 MR. WENTWORTH: And how would you have been  
19 expected to reach him if you needed him?

20 THE WITNESS: I would call him on the  
21 intercom telephone.

22 MR. WENTWORTH: And where was that located?

23 THE WITNESS: Here on the supervisor's desk  
24 behind me approximately eight feet.

1           MR. WENTWORTH: Okay. Did you receive or  
2 take any telephone calls while you were on duty prior  
3 to the accident?

4           THE WITNESS: You're referring to non-  
5 business-related calls?

6           MR. WENTWORTH: Yes, that's correct.

7           THE WITNESS: No, sir. I did not.

8           MR. WENTWORTH: Or anything to do with the  
9 phone on the supervisor's desk which would have taken  
10 you away from the operation?

11          THE WITNESS: No, sir. I do not recall  
12 receiving any phone calls from the telephone on the  
13 supervisor's desk.

14          MR. WENTWORTH: Thank you.

15                 Thank you, Teddy.

16          Now, when you came on duty could you tell us  
17 what was not functional while you were working?

18          THE WITNESS: The primary radar on the long-  
19 range radar system was out of service, and the glide  
20 slope portion of the ILS was out of service.

21          MR. WENTWORTH: And the impact of not having  
22 the primary, did that have anything to do with your  
23 being able to depict weather?

24          THE WITNESS: Yes, there was no weather  
25 depicted on the long-range radar system.

1           MR. WENTWORTH: However, it would have been  
2 depicted on the ASR 8?

3           THE WITNESS: Yes, sir, which I normally set  
4 at a 60-mile range and the long-range radar set for a  
5 250-mile range.

6           MR. WENTWORTH: Was a staffing complement of  
7 two controllers on duty that morning? To your  
8 knowledge, was that a standard staffing level?

9           THE WITNESS: Yes, sir. It was.

10          MR. WENTWORTH: Now, based on your knowledge  
11 of the weather that prevailed throughout the area that  
12 morning, is that -- were those weather conditions  
13 pretty standard or -- for that time of the season or  
14 that time of the year?

15          THE WITNESS: Yes. During that time of the  
16 year we have frequent rain showers in the area ranging  
17 from light rain showers to heavy thunderstorms.

18          MR. WENTWORTH: And based on the fact that  
19 the glide slope was out of service you advised the crew  
20 that it was unusable. Is this terms relevant to air  
21 traffic control phraseology?

22          THE WITNESS: Yes, sir. I used the phrase  
23 exactly out of our handbook. "Glide path or glide  
24 slope unusable."

1           MR. WENTWORTH: In your view, did the crew  
2 acknowledge the fact that it was unusable?

3           THE WITNESS: Yes, sir. The pilot  
4 acknowledged my clearance by the use of the word  
5 "Roger" in addition to a partial read back of the  
6 clearance.

7           MR. WENTWORTH: To your knowledge, is there  
8 any requirement for you to receive every word of a  
9 clearance that you issued to a flight crew?

10          THE WITNESS: I must ensure that the pilot  
11 acknowledges my clearance and the pilot make  
12 acknowledge of the clearance by use of terms such as  
13 "Roger," "Wilco," "Affirmative," or other words or  
14 phrases.

15          MR. WENTWORTH: But if he does not parrot it  
16 back to you, in other words, speak every particular  
17 phrase that you issued and does in fact give a -- a  
18 reply with a "Roger" or the aircraft call sign or  
19 something of that nature, does that indeed constitute  
20 acknowledgement?

21          THE WITNESS: The word "Roger" it -- in and  
22 of itself according to our handbook means that the  
23 pilot received and understood my last clearance in its  
24 entirety.

1           MR. WENTWORTH: Mr. Mayo, prior to this  
2 accident did you or your colleague receive any pilot  
3 reports of any NAV/AID difficulties or outages?

4           THE WITNESS: No, sir. We did not.

5           MR. WENTWORTH: To your knowledge, did any  
6 other aircraft execute the ILS to runway 6-left and  
7 safely land?

8           THE WITNESS: I do not recall at this time  
9 aircraft executing an ILS prior to the Korean Airlines.  
10 The most -- closest previous arrival was 35 minutes  
11 earlier, and the aircraft executed visual approach.

12          MR. WENTWORTH: Now, you relieved a colleague  
13 at that position. If he had received a report of  
14 difficulties with that particular approach would he  
15 have been required to advise you of such?

16          THE WITNESS: Yes, sir. He would have been.

17          MR. WENTWORTH: And I take it that he did  
18 not?

19          THE WITNESS: No, I did not receive any  
20 briefing to that effect.

21          MR. WENTWORTH: Thank you. Are any of the  
22 NAV/AIDs that serve the Guam International Airport  
23 monitored by your facility?

24          THE WITNESS: In our radar room we only  
25 monitor the VOR or the VORTAC.

1           MR. WENTWORTH: And if an alarm occurs is  
2 there a way in which you would receive it?

3           THE WITNESS: The monitor provides an oral  
4 and a visual alert. Yes, sir.

5           MR. WENTWORTH: And during the period that  
6 you were on duty did you receive any such alarms?

7           THE WITNESS: No, sir. I did not.

8           MR. WENTWORTH: Moving to the approach  
9 clearance that was issued to Korean Air 801, is there  
10 specific information which must be issued to the crew  
11 when he's cleared for a specific instrument approach  
12 procedure such as the ILS?

13          THE WITNESS: Generally speaking, the  
14 elements of the clearance are aircraft call sign,  
15 aircraft position, perhaps a vector, an altitude to  
16 maintain -- until established on the final approach  
17 course, and then any appropriate remarks -- including  
18 the approach clearance.

19          MR. WENTWORTH: And would you explain for us  
20 on the long-range radar are any of the elements of the  
21 ILS to runway 6-left at Guam depicted, such as the  
22 outer marker or the extended center line for the  
23 runway?

24          THE WITNESS: We have a map that we can  
25 display on the long-range radar. At the time it was

1 not displayed on the long-range radar.

2 MR. WENTWORTH: Would it have been displayed  
3 on the ASR 8?

4 THE WITNESS: Yes, it was.

5 MR. WENTWORTH: It was, sir?

6 THE WITNESS: Yes, it was, sir.

7 MR. WENTWORTH: Okay. Can you tell me what  
8 the purpose or rather how the extended center line is  
9 depicted, first of all?

10 THE WITNESS: The extended runway center line  
11 or the final approach course is an extension of the  
12 runway out to approximately 12 miles from the airport  
13 depicted by dashed lines in one-mile increments.

14 MR. WENTWORTH: Now, based on the clearance  
15 that was issued to Korean Air 801, it's noted that they  
16 were not issued an altitude to maintain. Can you tell  
17 us why that might have occurred?

18 THE WITNESS: I observed the aircraft  
19 established on a segment of the approach at the  
20 assigned altitude and I thought it would have been  
21 redundant.

22 MR. WENTWORTH: We also noted that the crew  
23 was not given their position relative to the outer  
24 marker. Can you tell us why that occurred?

1           THE WITNESS: No sure -- no, sir. I should  
2 have given them their position.

3           MR. WENTWORTH: At what point did you  
4 transition from the long-range radar to the ASR 8 in  
5 determining the position of Korean Air 801?

6           THE WITNESS: Well, I was continually  
7 scanning back and forth between the two radar systems.

8           When I issued the vector for the intercept I'm certain  
9 I was looking at the short-range radar, the ASR 8, and  
10 when I switched frequencies to the Agana Tower I'm  
11 certain I was observing the aircraft on the ASR 8.

12          MR. WENTWORTH: At the time that you issued  
13 the approach clearance to the crew of Korean Air 801,  
14 were there any weathers of area being depicted on the  
15 terminal radar system?

16          THE WITNESS: Yes, sir. There was.

17          MR. WENTWORTH: Can you describe for us your  
18 observations?

19          THE WITNESS: There was an area of weather  
20 approximately from three to six miles on final -- on  
21 the approach course.

22          MR. WENTWORTH: That was along the approach  
23 course, sir?

24          THE WITNESS: Yes, sir. It was on the  
25 approach course.

1           MR. WENTWORTH: Did you have any idea of what  
2 the intensity level might have been?

3           THE WITNESS: No, sir. I did not. I had not  
4 received any information of any significant weather in  
5 the area.

6           MR. WENTWORTH: Did you advise the crew of  
7 Korean Air 801 about your observations of this weather?

8           THE WITNESS: No, sir. I did not.

9           MR. WENTWORTH: Did you advise the local  
10 controller at Agana Tower about the weather?

11          THE WITNESS: No, sir. I did not.

12          MR. WENTWORTH: Is there any requirement for  
13 you to have done so?

14          THE WITNESS: Yes, sir. There is.

15          MR. WENTWORTH: Can you tell us why that did  
16 not occur?

17          THE WITNESS: I assume that the flight crew  
18 was using their cockpit radar as they had twice  
19 previously asked for deviations around weather while I  
20 was working with them. And their cockpit radar is more  
21 accurate and more precise than the radar that I have.

22                 And the tower, I -- I failed to inform them

23                 --

24                 (Pause)

1           MR. WENTWORTH: All right. Mr. Mayo, when  
2 was your last observation of the target in the data  
3 block of Korean 801 on radar? When did that occur?

4           THE WITNESS: The last ~~time~~ I remember  
5 observing the data block was when I switched them to  
6 the tower. I'm certain that I scanned back to the data  
7 block at some time later. But I don't recall precisely  
8 when that might have been.

9           MR. WENTWORTH: When you advised the crew to  
10 go to the tower, did you look at the data block at that  
11 particular time? Is that what I understood?

12          THE WITNESS: Yes, sir. I did.

13          MR. WENTWORTH: What was the altitude of the  
14 aircraft at that time? Do you recall?

15          THE WITNESS: To my best memory, 200feet.

16          (Pause)

17          MR. WENTWORTH: Did you observe the data  
18 block on radar go into coast at any point?

19          THE WITNESS: No, sir. I did not.

20          (Pause)

21          MR. WENTWORTH: Prior to being advised by the  
22 local controller that he was no longer in contact with  
23 the flight, did you continue to monitor the aircraft's  
24 progress to the airport in any manner?

1           THE WITNESS: Yes, sir. I -- I scanned my  
2 radar scopes and I'm sure that I saw the data block at  
3 different occasions during the approach. I continued  
4 to provide radar monitoring.

5           CHAIRMAN FRANCIS: Richard, we're -- we're  
6 having a little trouble with the interpretation here,  
7 so if we can just slow it down a little bit just so  
8 that they can keep up, and -- and Mr. Mayo, if you  
9 could as well. It's -- it's kind of tough for those  
10 folks.

11          MR. WENTWORTH: Sure. I understand. Thank  
12 you.

13          After being told by the local controller that  
14 the aircraft was down, why did you believe you needed  
15 to have a confirmation from another airborne aircraft  
16 if you monitored the progress of the aircraft?

17          THE WITNESS: Would you please restate that?

18          MR. WENTWORTH: After being advised by the  
19 local controller that he was no longer in contact with  
20 Korean Air 801, why did you believe you needed a  
21 confirmation from another airborne aircraft,  
22 specifically Ryan 789?

23          THE WITNESS: I was fairly certain in my mind  
24 that the aircraft had crashed, but I thought it would  
25 be best and -- to get a confirmation visually, and Ryan

1 was in a perfect position to observe the area.

2 MR. WENTWORTH: So at what point did you  
3 initiate either a crash response or get your associate  
4 in the control room? What -- what -- at what point did  
5 that occur?

6 THE WITNESS: When the pilot of the Ryan  
7 aircraft advised me that he saw a fire on the hillside  
8 I was certain. At that time I contacted my co-worker  
9 who began making the appropriate phone calls.

10 MR. WENTWORTH: Well, if you felt that the  
11 aircraft had crashed before getting the confirmation,  
12 would it have been incumbent upon you to initiate some  
13 type of crash response?

14 THE WITNESS: Yes, sir. It may have been. I  
15 just wanted to be -- I wanted to be 100 percent sure.

16 MR. WENTWORTH: I'd like you to refer to  
17 Exhibit 3G, please, Mr. Mayo.

18 (Pause)

19 MR. WENTWORTH: If you would look at the --  
20 this is the facility accident incident notification  
21 record that was developed by the CERAP for which you  
22 work. And if you'll notice the second block there, it  
23 says, "Government of Guam off-base crash." Do you have  
24 specific procedures for a crash that occurs off Guam  
25 International Airport?

1 THE WITNESS: Yes, we do.

2 MR. WENTWORTH: Can you explain what those  
3 would be?

4 THE WITNESS: We have a checklist book at the  
5 supervisor's desk that gives us a list of what parties  
6 to call.

7 MR. WENTWORTH: And what -- I noticed on the  
8 next line there it says, "U.S. Coast Guard Search and  
9 Rescue." Is the response to them initiated concurrent  
10 with an off-airport crash?

11 THE WITNESS: The Coast Guard is always  
12 notified.

13 (Pause)

14 THE WITNESS: They assist in on-shore as well  
15 as off-shore.

16 MR. WENTWORTH: Did you make any of these  
17 notifications on the sheet?

18 THE WITNESS: No, sir. I was working the  
19 radar, and my co-worker made the calls.

20 MR. WENTWORTH: You will notice the times  
21 that are listed on the sheet. There is a listing for  
22 the facility manager, Mr. Cornelison, and it shows a  
23 time of 16:02. Do your procedures require that he be  
24 the first person notified in the event of an accident?

1 THE WITNESS: First, we should notify the  
2 Coast Guard or the search-and-rescue parties.

3 MR. WENTWORTH: Mr. Mayo, did you observe any  
4 visual MSAW alerts for Korean Air 801?

5 THE WITNESS: No, sir. I did not.

6 MR. WENTWORTH: Based on the record we know  
7 that one was indeed developed. If you had observed it,  
8 where would it have been displayed as it would have  
9 been generated by the Micro-EARTS radar -- automation?

10 MR. WENTWORTH: Only on the long-range radar  
11 system, and the letters MSAW would flash in the lower  
12 portion of the data block as well as being displayed in  
13 the alert tab list. The call sign would be -- the call  
14 sign would be displayed in the alert tab list on the  
15 scope.

16 MR. WENTWORTH: And where was that particular  
17 list located on your radar scope?

18 THE WITNESS: The alert tab list was located  
19 at the upper and center portion of my scope.

20 MR. WENTWORTH: To your knowledge, sir, is  
21 there an MSAW speaker in the control room?

22 THE WITNESS: Yes, sir. There is.

23 MR. WENTWORTH: And can you tell me where  
24 that's located?

1           THE WITNESS: To the right of the R4 position  
2 approximately 10 to 15 feet above one of the radar  
3 scopes. It's clearly audible throughout the room from  
4 that position.

5           MR. WENTWORTH: Prior to be notified by the  
6 tower that he was no longer in contact with Korean Air  
7 801 did you hear any oral MSAW alerts?

8           THE WITNESS: No, sir. I did not.

9           MR. WENTWORTH: Prior to the day of this  
10 accident were you aware that the alert system, the MSAW  
11 was virtually non-existent?

12          THE WITNESS: No, sir. I was not.

13          MR. WENTWORTH: Prior to the day of this  
14 accident were you aware that you would not receive an  
15 oral MSAW alert from the Micro-EARTS system?

16          THE WITNESS: No, sir. I was not.

17          MR. WENTWORTH: Do you provide approach  
18 control services to other airports?

19          THE WITNESS: Yes, we do.

20          MR. WENTWORTH: Other than Guam  
21 International?

22          THE WITNESS: Yes, sir. We do.

23          MR. WENTWORTH: For instance, which airports,  
24 sir?

1           THE WITNESS: Anderson Air Force Base, which  
2   is located on the island of Guam; Rhode International  
3   Airport; Tinian and Saipan International Airport.

4           MR. WENTWORTH: Can you tell me what a safety  
5   alert is, Mr. Mayo?

6           THE WITNESS: A safety alert is an --  
7   advisory to an aircraft to alert them of a situation  
8   which may be unsafe.

9           MR. WENTWORTH: In what response -- in what --  
10   - in what level of hierarchy of -- in your job does  
11   that particular function fall?

12          THE WITNESS: It along with separation is a  
13   first priority.

14          MR. WENTWORTH: Do you consider issuing --  
15   excuse me, sir. Do you consider MSAW in itself, this  
16   particular function, as a safety feature?

17          THE WITNESS: Yes, sir. I do.

18          MR. WENTWORTH: In your view as a controller,  
19   do you believe that MSAW provides protection for you in  
20   doing your job?

21          THE WITNESS: Protection for me?

22          MR. WENTWORTH: For yourself.

23          THE WITNESS: It assists me in doing my job.

24          MR. WENTWORTH: Can you amplify how it would  
25   assist you?

1           THE WITNESS: It alerts me to situations  
2       which may be unsafe so that I can alert the crew  
3       members or the controller who's in control of the  
4       aircraft.

5           MR. WENTWORTH: To your knowledge, is MSAW  
6       now working at Guam?

7           THE WITNESS: Yes, sir. It is.

8           MR. WENTWORTH: I don't believe I have any  
9       further questions. Thank you.

10          CHAIRMAN FRANCIS: All right. We'll now go  
11       to the party questioning of Mr. Mayo, and we'll start  
12       with the Korean accredited representative. It'll take  
13       us a second here so all of us can get our headsets on.

14          (Pause)

15          CHAIRMAN FRANCIS: You all right, Mr. Mayo?  
16       You okay?

17          THE WITNESS: Yes, sir.

18          CHAIRMAN FRANCIS: All right. Korean CAB?

19          MR. LEE: Mr Chairman, thank you very much.  
20       And ladies and gentlemen, thank you very much. Mr.  
21       Kurt Mayo, thank you very much.

22          (The following is a verbatim transcript of  
23       the English translation of Mr. Lee's questions posed in  
24       Korean and Mr. Mayo's responses in English.)

1           MR. LEE: Are there seven positions at the  
2 Guam Control Tower, including CERAP coordinator  
3 approach control, oceanic, and domestic?

4           THE WITNESS: No, sir. There are six.

5           MR. LEE: If that is the case, then when  
6 approach clearance was issued for KAL 801, were you,  
7 Kurt Mayo, there on your own, by yourself?

8           THE WITNESS: There were two persons on duty.

9           MR. LEE: Okay. Then, you two started to  
10 work together. However, the other controller was on  
11 duty only an hour then went on break. Is that what  
12 happened?

13          THE WITNESS: I'm not certain of the amount  
14 of time that he worked prior to his break.

15          MR. LEE: Regarding the breaks at your  
16 control center, is there any formalized way of taking  
17 duties on a shift basis, such as a staggering fashion,  
18 or is it that you can take a break at any time of your  
19 choosing?

20          THE WITNESS: The breaks are based on the  
21 traffic load, the number of persons assigned to the  
22 shift, and it's normally controlled by the supervisors  
23 or the controller-in-charge.

24          MR. LEE: When the approach clearance was  
25 issued for KAL 801, were both radars used, one for en

1 route and the other for approach control?

2 THE WITNESS: Yes, sir. I was scanning back  
3 and forth between both radar scopes, the long-range and  
4 the short-range.

5 MR. LEE: When approach clearance was issued,  
6 I understand there were eight aircraft which received  
7 approach clearance. Of the eight, how many were given  
8 clearance using the en route radar and how many using  
9 the approach control?

10 (End of translation)

11 CHAIRMAN FRANCIS: Could we -- excuse me.  
12 Could we stop for a minute, please? We've got two  
13 things. Number one, the court reporter is having a  
14 problem here, and let's get that clarified because  
15 that's the official record. So, what -- what do we  
16 need to do here, Carolyn?

17 (Pause)

18 CHAIRMAN FRANCIS: Please be back -- it's now  
19 10:30 -- at 10:45. We'll make it a 15-minute break.

20 (Whereupon, a brief recess was taken.)

21 CHAIRMAN FRANCIS: We'll resume the -- the  
22 KCAB, still questioning Mr. Mayo. And go ahead,  
23 gentleman.

24 (The following is a verbatim transcription of  
25 the English translation of Mr. Lee's questions posed in

1 Korean and Mr. Mayo's responses in English.)

2 MR. LEE: On the previous occasion in  
3 connection with your working system at your control  
4 tower following the accident, the work system that you  
5 had set up might have been changed. If the -- if that  
6 was the case, if there were any changes, can you tell  
7 us what actions you take following the accident?

8 THE WITNESS: The MSAW system was changed.

9 MR. LEE: FAA Order 7110.65K. According to  
10 the regulation of said FAA Order there are such  
11 provisions. Let me read. "If -- is this -- if  
12 altitude heading or other items are read -- are read  
13 back by the pilot ensure the read-back is correct. If  
14 incorrect or incomplete make corrections as  
15 appropriate."

16 However, with respect to the accident  
17 aircraft, Korean Air Aircraft, when you were issuing  
18 approach clearance you -- Korean Air 801 -- Korean 801  
19 cleared for ILS runway 6-left approach, glide slope  
20 unusable. When you said that the -- the Korean Air  
21 pilot read back just simply, quote, "Korean 801, roger.  
22 Cleared for ILS runway 6-left," quote. As the result,  
23 the glide scope -- "glide slope unusable" section was  
24 not read back. Did you notice that and correct that?

1           THE WITNESS: Yes, sir. I noticed that. I  
2     only need to correct the read-back if the pilot's read-  
3     back was incorrect. Nothing that he read in his read-  
4     back was incorrect. And the use of the term "Roger" in  
5     and of itself is sufficient. The word "Roger"  
6     according to the pilot controller glossary in our  
7     handbook means that the pilot has received and  
8     understands my last clearance in its entirety.

9           CHAIRMAN FRANCIS: And I would say again Mr.  
10    Mayo has already been asked this question and answered  
11    it to Mr. Wentworth.

12           MR. LEE: Okay. Let me then move on to one  
13    more question.

14           FAA Order 7110.65K 5-1-17, radar service  
15    termination. According to the said regulation radar  
16    service termination should be notified to the accident  
17    aircraft. That is my understanding. Did you actually  
18    do that to the accident aircraft?

19           THE WITNESS: Would you please restate the  
20    question?

21           MR. LEE: FAA Order -- according to FAA Order  
22    7110.65K, air traffic control paragraph 51-13, radar  
23    service termination. According to the provisions of  
24    the regulation, CERAP power controller should notify  
25    radar service termination to the accident aircraft.

1 And what I asked you just now is that whether you  
2 performed that obligation.

3 THE WITNESS: The section also reads that  
4 radar service is automatically terminated and the pilot  
5 not -- need -- need not be advised when the aircraft  
6 lands. Radar service is automatically terminated and  
7 the pilot need not be advised when the aircraft lands.

8 MR. LEE: Just bear with me. Let me have  
9 time to just ask two more questions.

10 Agana Tower D-BRITE increment was established  
11 as of January 1997. Were you aware of that?

12 THE WITNESS: I am aware that the Agana Tower  
13 has a D-BRITE.

14 MR. LEE: And then let me ask you the final  
15 question. At the time of the accident 15:32 hours  
16 there was official weather advisory. With respect to  
17 this official weather advisory measurement, did you  
18 receive any notification from the Agana Control Tower?

19 THE WITNESS: No, sir. I did not.

20 MR. LEE: Okay. Then let me follow up on  
21 that question to ask you whether you received any such  
22 weather advisory notification from any other  
23 organizations, including the Weather Bureau?

24 THE WITNESS: No, sir. I did not.

1           MR. LEE: At the CERAP are there any -- any  
2 receiving increment to receive meteorological  
3 information?

4           THE WITNESS: Yes, sir. There -- there is.  
5 There's a teletype printer and also a weather  
6 television monitor.

7           MR. LEE: FAA Order 7110.65K 4-7-8, weather  
8 information regulation. According to the provisions  
9 set forth in this particular regulation, the controller  
10 -- when there is official weather or meteorological  
11 advisory either the controller is supposed to issue  
12 instrument landing clearance or issue notification  
13 based on that. At that time did you notify the pilot  
14 of the accident aircraft, Korean Air aircraft such  
15 notice?

16          THE WITNESS: -- the questions.

17          MR. LEE: The controller, when he receives or  
18 recognize a special weather advisory prior to issuing  
19 instrument landing clearance, he should notify the  
20 pilot of the special weather advisory status or  
21 information or to include such information within such  
22 instrument landing clearance. That is the regulation.  
23 Did you ever notify the Korean Air pilot of any such  
24 special weather advisory information?

1 THE WITNESS: No, sir. I did not. I was not  
2 aware of any special weather or significant weather in  
3 the area.

4 MR. LEE: Thank you very much. That's all.

5 (End of translation)

6 CHAIRMAN FRANCIS: Thank you.

7 Boeing Company?

8 MR. DARCY: Thank you, Mr. -- excuse me, Mr.

9 Chairman. We don't have any questions for the witness.

10 CHAIRMAN FRANCIS: Thank you.

11 Barton ATC?

12 MR. E. MONTGOMERY: No, Mr. Chairman. No

13 questions.

14 CHAIRMAN FRANCIS: Korean Air?

15 CAPTAIN KIM: No questions.

16 CHAIRMAN FRANCIS: NATCA?

17 MR. MOTE: Yes, thank you, Mr. Chairman.

18 Mr. Mayo, in your almost 20 years experience  
19 as an air traffic controller in the Navy, Los Angeles  
20 approach, and now Guam CERAP, has it been a fairly  
21 common experience --

22 CHAIRMAN FRANCIS: Excuse me. Slower,  
23 please. Controllers -- we understand the controller's  
24 business is to speak fast, but here you've got to sort  
25 of work in reverse.

1 MR. MOTE: Yes, sir. Thank you, Mr.  
2 Chairman.

3 In your experience, is it a common daily  
4 occurrence for flight crews to read back clearances and  
5 acknowledge clearances, particularly with respect to  
6 approach clearances with terms such as "roger" and  
7 perhaps with partial acknowledgement of elements of  
8 that clearance?

9 THE WITNESS: Yes, sir. It is.

10 MR. MOTE: Thank you. And also, in your  
11 experience as a controller, do you operate with the  
12 daily anticipation -- in other words, is it your  
13 expectation that flight crews that are coming into your  
14 air space will comply with the FARs by familiarizing  
15 themselves with NOTAMS and equipment outages affecting  
16 their flight? Do you operate with that expectation?

17 THE WITNESS: Yes, sir. I do.

18 MR. MOTE: And based on the answer to that --

19 CHAIRMAN FRANCIS: Slowly. Slowly.

20 MR. MOTE: Sorry.

21 And based on that answer, given the fact that  
22 you expect the crews to be familiar with outages and  
23 other things affecting the condition of that flight and  
24 given the fact that you ensured that the flight crew  
25 had or was receiving the ATIS uniform in effect at the

1 time, which broadcast the glide slope outage, and given  
2 the fact that you issued the handbook phraseology  
3 "glide slope unusable" in the approach clearance, was  
4 there any doubt in your mind that this crew should have  
5 been aware that the glide slope was not in service at  
6 the time the approach clearance was issued?

7 THE WITNESS: No, sir. There was not.

8 MR. MOTE: Okay. Thank you.

9 That's all, Mr. Chairman. Thank you very  
10 much.

11 CHAIRMAN FRANCIS: Government of Guam?

12 MR. DERVISH: No questions, sir.

13 CHAIRMAN FRANCIS: FAA?

14 MR. DONNER: Thank you, Mr. Chairman.

15 Mr. Mayo, just two short questions. What  
16 would you characterize your workload as at the time of  
17 the accident?

18 THE WITNESS: Light to moderate.

19 MR. DONNER: And the complexity of the  
20 situation at that time?

21 THE WITNESS: I'd characterize the complexity  
22 as routine.

23 MR. DONNER: Thank you very much. Thank you,  
24 sir.

1 CHAIRMAN FRANCIS: All right. Thank you.  
2 That completes the parties.

3 Mr. Feith, you got anything further?

4 MR. FEITH: I just have a couple of  
5 questions, sir.

6 Mr. Mayo, with regard to the MSAW, have you  
7 received any formal training on the MSAW in your  
8 position?

9 THE WITNESS: I've received courses and I  
10 feel that I've been well-trained in MSAW. I know what  
11 it is, I know how to use it.

12 MR. FEITH: Can you just characterize for me  
13 the type of training that you would have received? Was  
14 it videos? Was it hands-on? Was it book work?

15 THE WITNESS: Written courses as well as  
16 videos.

17 MR. FEITH: How long a training period is  
18 that? A day? A month? A year? How much training?

19 THE WITNESS: Each session may last for 30 to  
20 60 minutes.

21 MR. FEITH: And with regards to recurrent  
22 training, do you receive recurrent training?

23 THE WITNESS: Yes, we do.

24 MR. FEITH: Prior to the accident had you  
25 received training on MSAW?

1 THE WITNESS: Yes, I had.

2 MR. FEITH: And subsequent to the accident  
3 have you received training on MSAW?

4 THE WITNESS: No, sir. I have not.

5 MR. FEITH: I have no further questions, Mr.  
6 Chairman.

7 CHAIRMAN FRANCIS: Pat?

8 MR. CARISEO: No questions, Mr. Chairman.

9 CHAIRMAN FRANCIS: I -- I'd -- I'd like to  
10 clarify one thing here. And this is something that's  
11 come up as -- during your testimony. This is the  
12 question of the difference between out of service and  
13 unusable, if there is a difference, in terms of the  
14 glide slope. When one reads the NOTAM, and you may not  
15 be the -- the person to answer this question, but the  
16 NOTAM says out of service. You said when you gave the  
17 clearance to the -- to the aircraft unusable. Is  
18 there, to your knowledge, a difference in these or is  
19 that effectively the same thing?

20 THE WITNESS: It's effectively the same  
21 thing.

22 CHAIRMAN FRANCIS: All right. Thank you. We  
23 appreciate your being here with us, and I understand  
24 you have to leave so that you will not be subject to  
25 perhaps coming back. We -- we do appreciate your

1 coming and being with us.

2 THE WITNESS: Thank you.

3 (Whereupon, the witness was excused.)

4 CHAIRMAN FRANCIS: The next witness is Mr.  
5 Marty Theobald, local controller, Barton ATC.  
6 Whereupon,

7 MARTY THEOBALD  
8 was called as a witness, and first having been duly  
9 sworn, was examined and testified as follows:

10 TESTIMONY OF

11 MARTY THEOBALD

12 LOCAL CONTROLLER

13 BARTON ATC INTERNATIONAL, INC.

14 AGANA CONTRACT AÆ TRAFFIC CONTROL TOWER

15 CHAIRMAN FRANCIS: Mr. Wentworth?

16 (Pause)

17 CHAIRMAN FRANCIS: Oh, I'm sorry.

18 MR. SCHLEEDE: Mr. Theobald, please state  
19 your full name and business address for our record.

20 THE WITNESS: Marty Theobald. 202 --  
21 correction. 2024 Piper Avenue, Pocatello, Idaho.

22 MR. SCHLEEDE: And what is your present  
23 position? Work position?

24 THE WITNESS: I'm an air traffic control  
25 specialist for Barton ATC International, Incorporated,

**EXECUTIVE COURT REPORTERS, INC.**  
**(301) 565-0064**

1 and I'm currently in training at that location.

2 MR. SCHLEEDE: Could you move just a little  
3 closer to the microphone, please?

4 THE WITNESS: Yes, sir.

5 MR. SCHLEEDE: Could you give us a brief  
6 description of your education and training and  
7 experience that -- qualifies you for your present  
8 position?

9 THE WITNESS: Yes, sir. I began my air  
10 traffic control experience with the United States Navy  
11 in 1983. I completed the air traffic control basic  
12 course in October of that year.

13 I was subsequently stationed in -- at an  
14 approach control facility in Texas. I was qualified as  
15 a ground controller and a flight data controller in the  
16 tower there as well as full facility rated in the radar  
17 facility.

18 I transferred from there in April of '89 and  
19 arrived in May in Guam at Naval Air Station, Agana,  
20 Guam. Subsequently, complete facility rated there both  
21 route -- and tower and radar. I also served  
22 approximately six months as the radar branch manager  
23 there.

24 April of '92 I was reassigned to the air  
25 traffic control facility officer as an administrative

1 assistant until my separation from Navy in October of  
2 '92.

3 I was hired by Barton Air Traffic Control,  
4 Incorporated -- I'm sorry. Barton Air Traffic Control  
5 International, Incorporated in May of '95 as an air  
6 traffic control specialist in Guam International  
7 Control Tower, which was the former NAS Agana Tower.

8 January of this year we had a opening at  
9 another facility and I requested a transfer. And I did  
10 transfer in February, and I'm in training now.

11 MR. SCHLEEDE: Thank you very much. Mr.  
12 Wentworth will proceed.

13 MR. WENTWORTH: Thank you, Mr. Schleede.

14 Mr. Theobald, you said that currently you're  
15 in Pocatello, Idaho?

16 THE WITNESS: Yes, sir.

17 MR. WENTWORTH: When did you transfer from  
18 Guam?

19 THE WITNESS: In February of this year.

20 MR. WENTWORTH: Was this at your request?

21 THE WITNESS: Yes, sir. It was.

22 MR. WENTWORTH: Are you medically --  
23 certified as a controller, sir?

24 THE WITNESS: Yes, sir. I am.

1           MR. WENTWORTH: Do you have any waivers or  
2 limitations?

3           THE WITNESS: No, sir.

4           MR. WENTWORTH: And when was your last  
5 physical, please?

6           THE WITNESS: October of last year, sir.

7           MR. WENTWORTH: And at the time that you were  
8 working in the tower on the night of this -- accident  
9 you were a fully certified controller at that time?

10          THE WITNESS: Yes, sir. I was.

11          MR. WENTWORTH: To your knowledge, is it  
12 standard procedure to work that particular shift by  
13 yourself?

14          THE WITNESS: Yes, sir. It is.

15          MR. WENTWORTH: Can you explain what the  
16 procedures would have been for taking a break to go to  
17 the bathroom or something like that?

18          THE WITNESS: You would normally wait until  
19 the traffic permits. You would coordinate with Guam  
20 CERAP that you would be out of the tower momentarily.  
21 You would also coordinate with airport authority's ramp  
22 control to let them know you would be out of the tower  
23 should an aircraft call on either ground or tower  
24 frequency. And you would take a hand-held with you  
25 when you went down to the facilities.

1           MR. WENTWORTH: Having seen this coordination  
2 take place, is it fair to say that you remained in the  
3 tower while you were on duty prior to the time of the  
4 accident?

5           THE WITNESS: Yes.

6           MR. WENTWORTH: Teddy, can you put up 3E for  
7 us, please?

8           (Pause)

9           MR. WENTWORTH: Mr. Theobald, this is a  
10 layout of the control tower. Can you tell us where you  
11 were primarily located during the course of the shift?

12          THE WITNESS: Primarily in this location,  
13 sir. In front of the local control position.

14          MR. WENTWORTH: Okay, sir. And to orient us  
15 of the view of the tower cab in relation to the  
16 runways, could you tell us where those would generally  
17 be?

18          THE WITNESS: Yes, sir. The runways would be  
19 located on this side.

20          MR. WENTWORTH: So your scan would be from  
21 your left to your right?

22          THE WITNESS: Yes, sir. The approach end of  
23 runway 6 would be this direction.

24          MR. WENTWORTH: Okay. And from the tower  
25 cab, where is the crash/fire/rescue station located?

1           THE WITNESS: Sir, it would be located on  
2 this portion over in here.

3           MR. WENTWORTH: Off to the right.

4           THE WITNESS: Yes, sir. Off to the right in  
5 the local control position.

6           MR. WENTWORTH: Now, would you point out for  
7 us the D-BRITE radar displays?

8           THE WITNESS: Yes, sir. There's one located  
9 here and there's one located here as well.

10          MR. WENTWORTH: Would you point out where the  
11 crash/fire/rescue phone is?

12          THE WITNESS: The crash phone would be  
13 located right here, sir.

14          MR. WENTWORTH: Could you show us where the  
15 monitor panel for the ILS six-left is?

16          THE WITNESS: Be located right here.

17          MR. WENTWORTH: And where do you receive your  
18 weather?

19          THE WITNESS: Comes in via a printer located  
20 right here, sir.

21          MR. WENTWORTH: Okay. Right --

22          THE WITNESS: I'm sorry. It would be right  
23 here.

24          MR. WENTWORTH: And then the ATIS recording  
25 station is just above that, is that correct?

1 THE WITNESS: Yes, sir. That would be ATIS.

2 MR. WENTWORTH: And where is the phone for  
3 the search and rescue?

4 THE WITNESS: We have a line that is located  
5 over in this that is a coordination line with the Coast  
6 Guard.

7 MR. WENTWORTH: Thank you.

8 Thank you, Teddy.

9 (Pause)

10 MR. WENTWORTH: Can we bring up the lights?

11 Thank you.

12 Would you pull out Exhibit 3H, hotel, please?

13 (Pause)

14 MR. WENTWORTH: My correction, Marty. That's  
15 3 foxtrot.

16 THE WITNESS: I'm sorry?

17 MR. WENTWORTH: 3 foxtrot. 3F.

18 THE WITNESS: Foxtrot?

19 (Pause)

20 MR. WENTWORTH: Okay. Sir, on page -- the  
21 first page here we see two ATIS messages.

22 THE WITNESS: I'm -- I'm sorry. I can't hear  
23 you, sir. I can't hear you.

24 MR. WENTWORTH: On the first page there are  
25 two ATIS -- there's two messages here, weather

1 sequences which appear to be marked U and V.

2 THE WITNESS: Yes, sir. The U and the V  
3 would be the letter for the phonetic alphabet of that  
4 ATIS broadcast.

5 MR. WENTWORTH: So, were those annotations  
6 made by you?

7 THE WITNESS: Yes, sir. That is my writing.

8 MR. WENTWORTH: If you'd look on the last  
9 page we have the sequence from the National Weather  
10 Service, and it would appear there's a mark on about  
11 the fourth one down. That particular sequence seems to  
12 be the same as the ATIS broadcast Uniform that you  
13 developed.

14 And then at the next mark further down at  
15 02:04 if you see that, Marty, on that last page?

16 THE WITNESS: Yes, sir.

17 MR. WENTWORTH: It appears that that sequence  
18 is the same as ATIS broadcast Victor.

19 THE WITNESS: Yes, sir.

20 MR. WENTWORTH: Okay. Now, it appears here  
21 in looking at the last page there are two specials, one  
22 issued at 01:32, 01:47, 0 -- the hourly at 01:50, and  
23 then a -- an additional three specials there.

24 THE WITNESS: Yes, sir.

1           MR. WENTWORTH: Can you tell us why these  
2 particular broadcasts or this weather was not  
3 disseminated by you as the local controller?

4           THE WITNESS: Sir, the special observation  
5 with the time of 01:32, I was in the process of  
6 recording that broadcast when CERAP called me with an  
7 in-bound which stopped me in the middle of that -- that  
8 recording. I went back to the recording and was in the  
9 process of checking it for correctness when the Korean  
10 Air aircraft checked in with me.

11           The ones beyond that were during the period  
12 when I was attempting to locate the aircraft and I was  
13 performing higher priority duties than the weather at  
14 that point.

15           MR. WENTWORTH: Are you certified to  
16 determine the prevailing visibility?

17           THE WITNESS: Yes, sir. I am.

18           CHAIRMAN FRANCIS: And in Guam in particular  
19 on -- on this accident?

20           THE WITNESS: I'm sorry?

21           MR. WENTWORTH: At Guam in particular during  
22 the time of this accident?

23           THE WITNESS: Yes, I was.

24           MR. WENTWORTH: At what point does the tower  
25 assume responsibility for determining prevailing

1 visibility?

2 THE WITNESS: If the visibility drops below  
3 five miles, sir.

4 MR. WENTWORTH: With the hourly weather  
5 sequence we see the visibility being reported as three  
6 statute miles. And then it reduces down to one, back  
7 up to two, and then back to four. Did you make any of  
8 these determinations of prevailing visibility?

9 THE WITNESS: No, sir. At that point I was  
10 involved in coordination reference the air -- accident  
11 aircraft and was searching for the aircraft as well.

12 MR. WENTWORTH: So, these would have been  
13 visibility at the surface as determined by the weather  
14 -- National Weather Service?

15 THE WITNESS: Yes. Those would be their  
16 determinations on visibility, sir.

17 (Pause)

18 MR. WENTWORTH: And if you'd look on page two  
19 of these sequences.

20 THE WITNESS: F2?

21 MR. WENTWORTH: F2, yes. That's correct,  
22 Marty.

23 There is a time of receiving 15:25 and then a  
24 time apparently of the sequence 15:32. There appears  
25 to be a disparity there. Can you explain what was

1 occurring?

2 THE WITNESS: I believe that that time in the  
3 -- the receiving time there is a time that's set in the  
4 system itself, the actual printer in the tower cab. It  
5 appears to be that the -- the clock on that was not  
6 correct.

7 MR. WENTWORTH: Is there a way that you had  
8 to set that or check that?

9 THE WITNESS: No, sir. We're not allowed to  
10 set any equipment or make any adjustments to any  
11 equipment in the control tower.

12 MR. WENTWORTH: Okay. Thank you.

13 (Pause)

14 MR. WENTWORTH: Go to 3 X-ray, page 12.

15 (Pause)

16 THE WITNESS: Yes, sir. I have that.

17 MR. WENTWORTH: Okay. This is the  
18 maintenance log for the glide slope at Guam. In the  
19 upper right-hand corner it's marked June 1997.  
20 However, in the middle of the page it's carried on to  
21 July of 1997. Do you see that?

22 THE WITNESS: Yes, sir. I do.

23 MR. WENTWORTH: I'd like to direct your  
24 attention to the July entry of the 7th where it says  
25 that the glide slope is out of service, to replace the

1 building coordination with ATCT, and then in parens  
2 (Marty), and then the MCC and in parens, (TC). The  
3 "Marty" that's being referred to on this particular  
4 log, was that you?

5 THE WITNESS: I would have -- correction. It  
6 appears to be, yes, sir. I'm the only Marty that works  
7 in the control tower.

8 MR. WENTWORTH: Okay, sir. So then you did  
9 have knowledge that the glide slope was out of service?

10 THE WITNESS: Not at that point, sir. I was  
11 on vacation then in the United States mainland on 7  
12 July.

13 MR. WENTWORTH: So, then somebody had to be  
14 mistaken when they put your name down here, is that  
15 correct?

16 THE WITNESS: Yes, sir. It appears that way.

17 MR. WENTWORTH: All right. Does the tower  
18 issue NOTAMs?

19 THE WITNESS: I'm sorry?

20 MR. WENTWORTH: Does the tower issue NOTAMs?

21 THE WITNESS: No, sir. We do not.

22 MR. WENTWORTH: Do you know who does?

23 THE WITNESS: I believe it would be Guam  
24 Airport Authority or the FAA Airways Facilities people  
25 or Maintenance Coordination Center in Honolulu.

1           MR. WENTWORTH: Okay. You pointed out for us  
2 earlier the monitor panel for the ILS to runway 6-left.

3           THE WITNESS: Yes, sir.

4           MR. WENTWORTH: In the event of a failure of  
5 either the glide slope or the localizer -- that is the  
6 two components that you would monitor, is that correct?

7           THE WITNESS: Yes, sir.

8           MR. WENTWORTH: Would you receive any type of  
9 an alert?

10          THE WITNESS: Yes, sir. There would be a  
11 visual actual change from one color light to another as  
12 well as an audible tone.

13          MR. WENTWORTH: Now, did you receive any type  
14 of audible alerts or visual alerts for the glide slope  
15 or the localizer that morning?

16          THE WITNESS: When I arrived to work to the  
17 best of my knowledge the glide slope was already in a  
18 failed position. A red light in the localizer was in  
19 the green, which would be the operational position.

20          MR. WENTWORTH: However, you were aware at  
21 that particular point the glide slope was indeed out of  
22 service, is that correct?

23          THE WITNESS: Yes, I was.

24          MR. WENTWORTH: During the time that you were  
25 on shift did you receive any reports from pilots of any

1 problems with NAV/AIDs that serve the airport?

2 THE WITNESS: No, sir. I did not.

3 MR. WENTWORTH: When Korean Air 801 was in-  
4 bound to the airport did you observe the flight?

5 THE WITNESS: No, sir. I never did see the  
6 aircraft.

7 MR. WENTWORTH: Did you know why you were not  
8 able to see the airplane?

9 THE WITNESS: No, sir.

10 MR. WENTWORTH: Did there become a point at  
11 which you believed you should have been able to see the  
12 airplane?

13 THE WITNESS: Yes, sir.

14 MR. WENTWORTH: And can you tell us when that  
15 was?

16 THE WITNESS: It would have been  
17 approximately three to four minutes after I cleared the  
18 aircraft to land.

19 (Pause)

20 MR. WENTWORTH: If you would, Marty, go to 3  
21 India, page 13.

22 (Pause)

23 THE WITNESS: Yes, sir.

24 MR. WENTWORTH: -- to the left on the page,  
25 paragraph 3-10-7. Landing clearance without visual --

1 THE WITNESS: I'm sorry. What -- what  
2 paragraph, sir?

3 MR. WENTWORTH: 3-10-7 on page 13.

4 (Pause)

5 THE WITNESS: Yes, sir.

6 MR. WENTWORTH: Okay. You see that to the  
7 left?

8 THE WITNESS: Yes, sir.

9 MR. WENTWORTH: Landing clearance without  
10 visual observation?

11 THE WITNESS: Yes, sir.

12 MR. WENTWORTH: We note that in the  
13 transcript that the flight was not told that they were  
14 not in sight. Can you tell us why they were not  
15 advised of this?

16 THE WITNESS: As this states, when an  
17 arriving aircraft reports a position where he should be  
18 seen but has not been visually observed, and I don't  
19 believe he was in a position where I should have  
20 visually seen him when he checked in with me.

21 MR. WENTWORTH: And based on what, sir?

22 THE WITNESS: The distance of the aircraft  
23 from the airport on the initial call from CERAP with  
24 the in-bound and his position distance from the airport  
25 being to the west to 12 miles.

1           MR. WENTWORTH: You heard the earlier  
2 testimony of Mr. Mayo that there was weather along the  
3 final approach course between the flight and the  
4 airport?

5           THE WITNESS: Yes, sir. I have.

6           MR. WENTWORTH: Had you known that ~~weather~~  
7 was out there would you have done anything differently?

8           THE WITNESS: Yes, sir. I would have.

9           MR. WENTWORTH: Could you amplify?

10          THE WITNESS: I would have immediately on  
11 initial contact with the aircraft I would have read him  
12 the weather observation that I was attempting to record  
13 at the time. And I -- if I had known that cell was  
14 there I would have issued that information to the  
15 aircraft as well to be sure that he had the  
16 information.

17          MR. WENTWORTH: And another point that I'd  
18 like to make, when you said that the monitor panel had  
19 a red light for the glide slope, what was being shown  
20 on the localizer? What did you receive on that?

21          THE WITNESS: On the status panel, sir?

22          MR. WENTWORTH: Yes, sir. On the status  
23 panel.

24          THE WITNESS: Yes, the glide slope was in the  
25 red, which would be the alarm position, and the

1     localizer was in the green, which would be the go  
2     indicator, operational.

3                 MR. WENTWORTH: Thank you. At what point did  
4     you become concerned about Korean Air 801?

5                 THE WITNESS: As I said before, approximately  
6     three to four minutes after I issued him his landing  
7     clearance he was not visible and not over the approach  
8     into the runway.

9                 MR. WENTWORTH: And so, then what did you do?

10                THE WITNESS: I commenced a communication  
11     search for the aircraft.

12                MR. WENTWORTH: Which included calling the  
13     ramp?

14                THE WITNESS: Yes, sir. It did.

15                MR. WENTWORTH: From the tower cab how far  
16     are the runway out in front of you?

17                THE WITNESS: Approximately one-quarter mile,  
18     sir.

19                MR. WENTWORTH: Can you normally hear  
20     aircraft landing in the -- and taking off?

21                THE WITNESS: Yes, sir. You can.

22                MR. WENTWORTH: After you called the CERAP  
23     and was told by them that the aircraft was no longer on  
24     radar, why did you call Anderson Air Force Base?

1           THE WITNESS: To ascertain whether or not the  
2 aircraft had possibly landed there, sir.

3           MR. WENTWORTH: Have you ever had a  
4 commercial air carrier land at Anderson inadvertently?

5           THE WITNESS: No, sir. It has not happened  
6 to me personally.

7           MR. WENTWORTH: Has it ever happened to your  
8 knowledge?

9           THE WITNESS: When I got to Guam it was one  
10 of the things in my training that they cautioned me on,  
11 that it had happened prior.

12          MR. WENTWORTH: Do you know whether this  
13 occurred during the day or -- or during -- at night?

14          THE WITNESS: I'm not sure if that was a day  
15 -- during the day or at night.

16          MR. WENTWORTH: In your view, was there a  
17 reluctance on your part to initiate a crash response?

18          THE WITNESS: No, sir. Not once I had some  
19 actual evidence and -- and a position and a location to  
20 send someone to.

21          MR. WENTWORTH: So you felt like you had to  
22 have a location before you could send vehicles out to  
23 nowhere?

24          THE WITNESS: Yes, sir.

1           MR. WENTWORTH: I see. And you pointed out  
2 for us earlier there's a crash -- a search-and-rescue  
3 phone on the tower cab. Did you use that in any  
4 manner?

5           THE WITNESS: No, sir. I did not.

6           MR. WENTWORTH: And why not?

7           THE WITNESS: We don't have an established  
8 procedure for using that for search-and-rescue type  
9 information. That's normally a line that's used for  
10 coordination between the Coast Guard and us, normally  
11 in-bound calls to the tower.

12          MR. WENTWORTH: And that's how you've seen it  
13 used?

14          THE WITNESS: Yes, sir.

15          MR. WENTWORTH: For an off-airport crash, do  
16 you still retain responsibility to initiate the  
17 crash/fire/rescue response?

18          THE WITNESS: Yes, sir. I would make the  
19 notification as soon as I become aware of it to ramp  
20 control, which would then make the notifications to the  
21 appropriate Government of Guam agencies.

22          MR. WENTWORTH: And now I'd like you to go to  
23 3H, please, Marty. This is the facility accident  
24 incident notification record.

1 (Pause)

2 THE WITNESS: I'm sorry. I don't have that.

3 (Pause)

4 THE WITNESS: Thank you. Yes, sir.

5 MR. WENTWORTH: At the first entry there at  
6 the top of the page it shows a time, and would you tell  
7 us what time that is?

8 THE WITNESS: 15:58 --

9 MR. WENTWORTH: And then there's initials.  
10 Who is that -- those initials?

11 THE WITNESS: Those are my initials behind  
12 that.

13 MR. WENTWORTH: T.O. is your initials?

14 THE WITNESS: Yes, sir. Those are my  
15 operating initials.

16 MR. WENTWORTH: And the recipient was Juan --  
17 does it appear?

18 THE WITNESS: Yes, sir.

19 MR. WENTWORTH: So, is this handwriting  
20 yours?

21 THE WITNESS: Yes, sir. That is.

22 MR. WENTWORTH: And when this entry was made,  
23 from where did you derive the time?

24 THE WITNESS: From my directory digital  
25 clocks in the tower on the local control position.

1 MR. WENTWORTH: Was it marked or annotated  
2 concurrent with the time you made the call?

3 THE WITNESS: I'm sorry?

4 MR. WENTWORTH: Was it marked concurrent with  
5 the time that you made the call?

6 THE WITNESS: Yes, sir.

7 MR. WENTWORTH: You showed us earlier that  
8 from the tower you were able to see the  
9 crash/fire/rescue -- the crash/fire station?

10 THE WITNESS: Yes, sir.

11 MR. WENTWORTH: After you made the  
12 notification did you see any of those trucks leave?

13 THE WITNESS: Not to my knowledge.

14 MR. WENTWORTH: During the duration of the  
15 time you were in tower?

16 THE WITNESS: No, sir.

17 MR. WENTWORTH: Do you know whether they have  
18 a requirement to leave the station for off-airport  
19 crash?

20 THE WITNESS: That would be based on the  
21 Airport Authority's releasing them, to my knowledge.

22 MR. WENTWORTH: Mr. Theobald, what -- what is  
23 a safety alert?

24 THE WITNESS: A safety alert would be a -- an  
25 alert that you would issue to an aircraft if you were

1     aware that he is too close to terrain, obstructions, or  
2     another aircraft.

3             MR. WENTWORTH:   Have ~~yo~~ received any formal  
4     training on MSAW?

5             THE WITNESS:    During wash -- which portion of  
6     my career, sir?

7             MR. WENTWORTH:   While you've been with  
8     Barton.

9             THE WITNESS:    No, sir.

10            MR. WENTWORTH:   During what portion have you  
11     received training?

12            THE WITNESS:    When I was an approach  
13     controller in -- when I was stationed in Texas we had  
14     an MSAW system there and I had some training there for  
15     it, sir.

16            MR. WENTWORTH:   So you basically know what it  
17     is?

18            THE WITNESS:    Yes, I understand what the  
19     system is.

20            MR. WENTWORTH:   Okay.   Had you been told by  
21     the CERAP controller to issue a safety alert to Korean  
22     Air 801, what would you have done?

23            THE WITNESS:    I would have issued the low  
24     altitude alert, check your altitude immediately, to the  
25     aircraft.

1           MR. WENTWORTH: I believe I have no further  
2 questions. Thank you.

3           CHAIRMAN FRANCIS: KCBA -- does KCAB?

4           (The following is a verbatim transcript of  
5 the English translation of Mr. Lee's questions posed in  
6 Korean and Mr. Theobald's responses in English.)

7           MR. LEE: You have pretty much covered all  
8 the questions that we originally intended to, so let me  
9 just touch up on several simple issues.

10          (Disruption in recording)

11          THE WITNESS: -- pilot report or notification  
12 from the FAA -- personnel -- was not operational.

13          MR. LEE: Let me just confirm one more thing.

14          On January 16, 1997, at Agana Tower there were two D-  
15 BRITEs installed at the Agana Control Tower. Up until  
16 -- up to the moment of accident, for about six months,  
17 for 24 hours around the clock the two D-BRITEs were  
18 turned on. Did you ever actually use the increment --  
19 D-BRITE increment? If you ever did, then please let me  
20 know, particularly with respect to the accident? Have  
21 you ever utilized D-BRITE system in connection with  
22 this accident?

23          THE WITNESS: No -- no, I did not use --  
24 utilize that system as it is not a certified system and  
25 it is not an operational piece of equipment.

1 (End of translation)

2 CHAIRMAN FRANCIS: Barton ATC?

3 MR. E. MONTGOMERY: I have no questions, Mr.  
4 Chairman.

5 CHAIRMAN FRANCIS: Government of Guam?

6 MR. DERVISH: Yes, sir. I just have a couple  
7 questions. And the first one's by way of  
8 clarification. I'm sorry I missed your answer, Marty.

9 At 01:58 you notified who?

10 THE WITNESS: Ramp Control, I'm sorry.

11 MR. DERVISH: Is there a notification list  
12 that you have for notification or do you just call Ramp  
13 Control?

14 THE WITNESS: Yes, sir. We do have a  
15 notification list. That would be the exhibit that I  
16 was looking at at the time, 3 Hotel.

17 MR. DERVISH: And who else did you notify?

18 THE WITNESS: My next call was to the  
19 facility and the air traffic manager, and then we  
20 commenced with the -- I commenced with my portion of  
21 this as I was able to with other things that were going  
22 on with coordination.

23 MR. DERVISH: So you -- you did contact 911  
24 and those --

1 THE WITNESS: I'm sorry?

2 MR. DERVISH: Who contacted 911?

3 THE WITNESS: It was not I. I don't know.

4 MR. DERVISH: And just by way of  
5 clarification again, and I might have missed it, did  
6 you say the clock might have been wrong in the tower?  
7 Or did I miss that?

8 THE WITNESS: That would be the printout  
9 clock for the weather --

10 MR. DERVISH: Oh.

11 THE WITNESS: -- received time.

12 MR. DERVISH: Okay. But you have a clock  
13 there that would have the accurate times for these  
14 notifications?

15 THE WITNESS: Yes, sir.

16 MR. DERVISH: Okay. Thank you.

17 THE WITNESS: You're welcome.

18 CHAIRMAN FRANCIS: NATCA?

19 MR. MOTE: Thank you, Mr. Chairman.

20 You stated in your answers to Mr. Wentworth a  
21 few moments ago that had the approach controller  
22 advised you of weather off -- on the final with regard  
23 to Korean Air you would advised the pilot of the -- of  
24 the special ATIS observation that you had, is that  
25 correct?

1 THE WITNESS: Yes.

2 MR. MOTE: The special weather at 01:32 --  
3 let me refer, by the way, to Exhibit 3 Foxtrot or the  
4 01:32 special observation page, that form.

5 (Pause)

6 THE WITNESS: Which page?

7 MR. MOTE: It's page F4.

8 THE WITNESS: Yes.

9 MR. MOTE: Do you see the approximately four  
10 lines down -- five lines down from the top, the special  
11 Guam observation, 01:32?

12 THE WITNESS: Yes.

13 MR. MOTE: There are rain showers or showers  
14 depicted on that special weather observation. Do you  
15 see that?

16 THE WITNESS: Yes, sir. I do.

17 MR. MOTE: I'm curious to know why you would  
18 advise the flight crew of showers on the final if the  
19 approach controller told you that but why you would not  
20 advise them when you have a hard copy showing showers  
21 in the vicinity of the airport. What -- what's the  
22 difference?

23 THE WITNESS: The showers that are located  
24 here are not on the final approach course, sir.

1 MR. WENTWORTH: So, you're -- so you're  
2 specifically relating it to the final, is that correct?

3 THE WITNESS: No, sir. What I -- the reason  
4 I would have passed that information would have been  
5 the ceiling information.

6 MR. MOTE: Okay. Thank you, Mr. Chair.

7 CHAIRMAN FRANCIS: Korean Air?

8 (The following is a verbatim transcript of  
9 the English translation of Captain Kim's questions  
10 posed in Korean and Mr. Theobald's responses in  
11 English.)

12 CAPTAIN KIM: Yes, let me ask one question.  
13 I'm with the Korean Airlines.

14 Of the questions that are asked by ATC  
15 chairman special weather conditions, why it was not  
16 notified to the aircraft -- pilot, the witness said the  
17 reason was called --

18 (Pause)

19 CHAIRMAN FRANCIS: I think we've got a  
20 problem -- hang on just a second.

21 (Pause)

22 CHAIRMAN FRANCIS: Go ahead.

23 CAPTAIN KIM: Among the questions asked by  
24 the chairman, the special weather conditions advisory  
25 which is not notified of the pilot and the -- why such

1 notification was not done. The witness answer was that  
2 it was because of radar recording matters. Was it also  
3 -- would it be interpreted as -- would it be reasonable  
4 to interpret your answer as the -- the tasks that you  
5 were performing -- you alone were performing were too  
6 demanding on any one person?

7 THE WITNESS: I'm not sure I understand the  
8 question as it was stated.

9 CAPTAIN KIM: Okay. Then, my assistant will  
10 ask the question in English.

11 FIRST OFFICER CHUNG: You -- one of your  
12 answers implied that the -- the reason the special  
13 observation was not transmitted to the pilot was  
14 because you were interrupted in the process, and we're  
15 asking if that -- if your answer implies in any way  
16 that at particular times during your shift your tasks  
17 might be too much for one person. Is that question  
18 clear, sir?

19 THE WITNESS: Yes, it is. And the answer  
20 would be no, I don't believe it's too -- too much for  
21 one person.

22 FIRST OFFICER CHUNG: Thank you.

23 CHAIRMAN FRANCIS: Do you have another  
24 question?

1 CAPTAIN KIM: No. Thank you very much.

2 (End of translation)

3 CHAIRMAN FRANCIS: Boeing Company?

4 MR. DARCY: Thank you, sir. We have no  
5 questions.

6 CHAIRMAN FRANCIS: FAA?

7 MR. DONNER: Thank you, Mr. Chairman. We  
8 have no questions.

9 CHAIRMAN FRANCIS: Greg?

10 MR. FEITH: I just have one question  
11 regarding the weather, and that is in reading the  
12 transcript when Ryan was turning onto the localizer  
13 coming in-bound and was asked whether they had seen 801  
14 and they were describing or in the process of looking  
15 for the aircraft, they stated that they went -- they  
16 just went IMC. And they -- they lost the airport. Did  
17 you do anything to get them to provide you a prep of  
18 some sort or any update to the weather given the fact  
19 that they just went IMC, which apparently wasn't the  
20 same condition at the airport? Was there any attempt  
21 to update the weather out there that you could provide  
22 to following aircraft?

23 THE WITNESS: I wasn't aware that they went  
24 IMC. They were not on my frequency when they were  
25 searching for the aircraft.

1 MR. FEITH: Okay. Thank you.

2 CHAIRMAN FRANCIS: Pat?

3 MR. CARISEO: No question.

4 CHAIRMAN FRANCIS: Ben?

5 MR. BERMAN: Mr. Theobald, you testified that  
6 you didn't make the crash call until you knew a  
7 position and location for the crash to send the units  
8 to. From whom did you ascertain the position and  
9 location and how did that go?

10 THE WITNESS: That was information that was  
11 passed to me by Guam CERAP from Ryan 789.

12 MR. BERMAN: Thank you

13 THE WITNESS: You're welcome.

14 CHAIRMAN FRANCIS: Monty?

15 MR. M. MONTGOMERY: Thank you -- thank you,  
16 Mr. Chairman. I do have one question.

17 In your tour of duty there at Guam, Mr.  
18 Theobald, have you ever received an MSAW alert of any  
19 kind?

20 THE WITNESS: No, sir. I've never worked in  
21 that tower when there was a functional MSAW capability  
22 in that control tower.

23 MR. M. MONTGOMERY: Did you ever get a call  
24 from approach control with such a message?

1 THE WITNESS: No, sir.

2 MR. M. MONTGOMERY: Thank you.

3 CHAIRMAN FRANCIS: Were you aware that the  
4 MSAW was not functional in the approach control?

5 THE WITNESS: No, sir. I was not.

6 CHAIRMAN FRANCIS: And could you -- could you  
7 just clarify for us a little bit the status of the D-  
8 BRITE in your -- in your facility?

9 THE WITNESS: The D-BRITE was an  
10 uncommissioned, unserviceable, non-certified piece of  
11 equipment at the time.

12 CHAIRMAN FRANCIS: So you basically were not  
13 using it at all for your ATC duties?

14 THE WITNESS: No, sir.

15 CHAIRMAN FRANCIS: Thank you very much.

16 THE WITNESS: You're welcome.

17 CHAIRMAN FRANCIS: That's good. Appreciate  
18 it.

19 (Pause)

20 CHAIRMAN FRANCIS: Mr. Theobald, the same  
21 thing applies to you. You're -- you're released now.  
22 I understand you want to leave as well.

23 (Whereupon, the witness was excused.)

24 CHAIRMAN FRANCIS: All right. Our next  
25 witness will be Ms. Sherrie Ewert, air traffic manager,

1     Barton ATC.

2     Whereupon,

3                     SHERRIE EWERT

4     was called as a witness, and first having been duly  
5     sworn, was examined and testified as follows:

6

7                     TESTIMONY OF

8                     SHERRIE EWERT

9                     AIR TRAFFIC MANAGER

10                    BARTON ATC INTERNATIONAL, INC.

11                    AGANA CONTRACT TRAFFIC CONTROL TOWER

12                    MR. SCHLEEDE:  Ms. Ewert, please state your  
13     full name and business address for the record.

14                    THE WITNESS:  My name is Sherrie Lynn Ewert.  
15     My business address is 1775 Adamborough Boulevard,  
16     Tgin, Guam.

17                    MR. SCHLEEDE:  And what is your present  
18     occupation?

19                    THE WITNESS:  Air traffic manager, Agana,  
20     Guam, and air traffic control specialist.

21                    MR. SCHLEEDE:  And how long have you held  
22     that position?

23                    THE WITNESS:  I've been a manager for  
24     approximately two years and I've been a specialist with  
25     Agana FCT for almost three years.

**EXECUTIVE COURT REPORTERS, INC.**  
**(301) 565-0064**

1           MR. SCHLEEDE: Would you give us a brief  
2 description of your education, training, and experience  
3 that brings you to your present position?

4           THE WITNESS: I went to Navy Air Traffic  
5 Control School, a school, from June of '76 to October  
6 '76. And then October '79 through November '79 I went  
7 to Navy Radar Air Traffic Control Facility school.  
8 June '86 to July '86 I went to Navy Facility Management  
9 Terminal En Route Procedure school.

10           I've been stationed at Naval Air Station  
11 Fallon; Naval Air Station Siganella, Sicily; again at  
12 Naval Air Station Fallon; Naval Air Station Agana,  
13 Guam; and then Agana FCT.

14           And I've been qualifications in flight  
15 planning, flight data, clearance delivery, tower  
16 visibility, ground control, local control, tower  
17 supervisor, radar final control, IFR data, desert data,  
18 IFR coordinator, arrival control, approach control,  
19 desert control, radar supervisor, facility watch  
20 supervisor, on-the-job training instructor, team  
21 leader, flight planning chief, tower chief, radar  
22 chief, training and standardization, ATCS examiner,  
23 control tower examiner, operations duty officer,  
24 command training team, facilitator, CPR instructor, air  
25 field driving instructor, carrier air group in-briefer,

1 controller-in-charge, air traffic manager.

2 MR. SCHLEEDE: Thank you very much. Mr.  
3 Wentworth will proceed. Please pause between some of  
4 the sentences so that the interpreters can keep up.

5 MR. WENTWORTH: Thank you. Good morning, Ms.  
6 Ewert.

7 THE WITNESS: Good morning.

8 MR. WENTWORTH: Based on your qualifications  
9 -- I heard you say both manager and controller, so you  
10 work as a controller at Guam International in addition  
11 to being manager of the facility?

12 THE WITNESS: Yes, sir.

13 MR. WENTWORTH: You maintain currency work on  
14 a daily basis?

15 THE WITNESS: Yes, sir.

16 MR. WENTWORTH: So you're considered a full  
17 performance level controller also?

18 THE WITNESS: Yes, sir.

19 MR. WENTWORTH: Would you provide for us an  
20 overview of your training program and how it's  
21 administered?

22 THE WITNESS: We have a person come into the  
23 facility and they have to complete all the courses and  
24 take graded tests prior to getting on position. They  
25 do on-the-job training. At the completion or what we

1 hope to be the completion FAA will send over a CTO  
2 examiner. They'll be observed and then certified by  
3 the FAA.

4 We continue periodic training, proficiency  
5 training as part of the program, which will include  
6 refresher training, supplemental training that might  
7 come along.

8 MR. WENTWORTH: Are emergencies and  
9 procedures for those emergencies covered as part of  
10 your remedial or supplemental training?

11 THE WITNESS: It's covered under the  
12 refresher training.

13 MR. WENTWORTH: Under refresher. Can you  
14 tell me what the average experience or level of  
15 experience within the tower is?

16 THE WITNESS: Approximately 15 years average  
17 experience.

18 MR. WENTWORTH: And out of the --~~hat~~ --  
19 what is the full staffing complement of the tower,  
20 please?

21 THE WITNESS: The full staffing now?

22 MR. WENTWORTH: Yes.

23 THE WITNESS: Seven.

24 MR. WENTWORTH: And out of that complement,  
25 how many have previous experience at Guam International

1 or Agana when it was under the Navy?

2 THE WITNESS: The number of people that are  
3 there now?

4 MR. WENTWORTH: Yes.

5 THE WITNESS: Two.

6 MR. WENTWORTH: And -- but yet, at the time  
7 of the accident Mr. Theobald had previous experience at  
8 that facility?

9 THE WITNESS: Yes.

10 MR. WENTWORTH: Okay.

11 THE WITNESS: That would have made it three  
12 at the time.

13 MR. WENTWORTH: Did the staffing or the  
14 midnight shift on August 6th, did it conform to the  
15 contractual requirements of Barton ATC, the FAA, or  
16 both?

17 THE WITNESS: Both.

18 MR. WENTWORTH: Both. As a contract  
19 facility, to what standards do you provide service to  
20 what level?

21 THE WITNESS: We provide 'em in accordance  
22 with FAA and company policy.

23 MR. WENTWORTH: So, those regulations that  
24 are applicable to the FAA controllers also applicable  
25 to -- to you?

1 THE WITNESS: Yes, sir.

2 MR. WENTWORTH: As a VFR facility, how is D-  
3 BRITE radar display used?

4 THE WITNESS: How is it normally used out of  
5 the --

6 MR. WENTWORTH: Yes. How is it used --

7 THE WITNESS: -- tower?

8 MR. WENTWORTH: -- not at the tower itself,  
9 but how would it be used?

10 THE WITNESS: It would be used as an aid to  
11 the -- the VFR tower controller. A term that's  
12 commonly used is an extension of the eye so you can get  
13 a geographical idea of where, like, the aircraft might  
14 be.

15 MR. WENTWORTH: But you do not separate  
16 aircraft through the use of the D-BRITE, is that  
17 correct?

18 THE WITNESS: We still don't separate with  
19 them the D-BRITE. We -- it would still just be used as  
20 an advisory.

21 MR. WENTWORTH: The two displays that we've  
22 been talking about that are currently in the tower, are  
23 they commissioned today as we speak?

24 THE WITNESS: No, sir.

1           MR. WENTWORTH: If the system is not  
2           commissioned, why does the facility log the system in  
3           and out of service? I -- I know I had to conduct a  
4           review of your facility logs. I noticed that.

5           THE WITNESS: We log them in the facility to  
6           help the FAA AF maintain a history of the status of the  
7           equipment.

8           MR. WENTWORTH: Can you provide us a history  
9           during your tenure at least of -- of the D-BRITE,  
10          please?

11          THE WITNESS: At the time that my company  
12          started working in the tower, there was a Navy brands  
13          in the tower, which is similar to the D-BRITE system.  
14          In October of '95 the Navy brands and all associated  
15          equipment was removed.

16          In January of '96 a remote display was  
17          installed. That is a display that is displayed up to  
18          the Anderson Air Force Control Tower.

19          In October of '96 there was a group of  
20          gentlemen that came out to do an overview for revamping  
21          of the control tower. I was told at that time that the  
22          D-BRITE system was going to be installed in Guam and  
23          that they even knew at that time already where they  
24          were going to be getting a system from.

1           In -- in February of '97 the D-BRITE system  
2       was transferred to the FAA.

3           In between November of '97 and January of '98  
4       digital maps were delivered and it's installed at Agana  
5       FTC.

6           In December of '97 some testing and more  
7       software was installed.

8           In December of '97 the Agana FCT or traffic  
9       control personnel received training on the D-BRITE.

10          And at present FAA AF is continuing to  
11       evaluate and optimize the system. The D-BRITE is  
12       currently not commissioned or certified.

13          MR. WENTWORTH: In your view as a manager,  
14       does this seem to be an -- extraordinarily long time in  
15       getting the system commissioned?

16          THE WITNESS: Well, this is the first time  
17       that I've been a manager and been associated with the  
18       FAA, and it's -- it's been an educational time for me  
19       to learn how things work.

20          The duration, I'm not really sure on that. I  
21       don't -- I don't have experience with them within this  
22       system to say how long it's been.

23          MR. WENTWORTH: Have you been told when the  
24       system is expected to be commissioned?

1 THE WITNESS: The latest word I have is the  
2 end of March, April time frame of this year.

3 MR. WENTWORTH: Of '98?

4 THE WITNESS: Yes, sir.

5 MR. WENTWORTH: Okay. Have you started  
6 training your people on the system at this point?

7 THE WITNESS: We've already received our  
8 training and we've already taken our test and we've  
9 already received the results back from the test.

10 MR. WENTWORTH: Has -- have you learned what  
11 the status of the D-BRITE was on the morning of the  
12 accident?

13 THE WITNESS: It was not a usable piece of  
14 equipment.

15 MR. WENTWORTH: Okay. When this new system,  
16 this D-BRITE system is commissioned, will it have MSAW  
17 capability?

18 THE WITNESS: Would you please ask that  
19 question again?

20 MR. WENTWORTH: When the -- when the D-BRITE  
21 system is indeed commissioned, will it have MSAW  
22 capability? That is, the ability to provide both oral  
23 and visual alerts to the controller?

24 THE WITNESS: My understanding is it will  
25 not.

1           MR. WENTWORTH: Will the components that  
2 would allow these warnings to be issued, will they be  
3 present in the system?

4           THE WITNESS: My understanding is they will.

5           MR. WENTWORTH: But in essence, inhibited?

6           THE WITNESS: Yes, sir.

7           MR. WENTWORTH: Now, is that just the oral or  
8 the visual portion?

9           THE WITNESS: I'm not --

10          MR. WENTWORTH: Or in total?

11          THE WITNESS: I'm -- I don't remember about  
12 the visual, but I -- the oral is what I remember for  
13 sure as being inhibited. I don't recall if the visual  
14 will be there or not.

15          MR. WENTWORTH: As the manager, do you  
16 believe that you should have that capability to receive  
17 both oral and visual?

18          THE WITNESS: I'm sorry. I missed the first  
19 part of your question.

20          MR. WENTWORTH: As the manager of the  
21 facility, do you believe that you should have the  
22 capability of receiving both oral and visual MSAW  
23 alerts?

24          THE WITNESS: My understanding is that FAA  
25 policy is that we will not receive oral.

1           MR. WENTWORTH: Earlier from Mr. Theobald we  
2 heard about the search-and-rescue line in the tower  
3 cab. And did Barton ATC or the Navy or if you can  
4 identify who requested that it be installed?

5           THE WITNESS: Barton did not request it. We  
6 had a similar line that was a Navy line when the Navy  
7 was there. That line was removed. I believe the line  
8 now is -- was installed by Guam Airport Authority, but  
9 I don't know as to what discussion or, you know, how  
10 that line came about, who decided to put the line in.  
11 I don't have that information.

12          MR. WENTWORTH: Therefore, you as a facility  
13 have no procedures for its use, formal procedures?

14          THE WITNESS: No, sir.

15          MR. WENTWORTH: With what ~~re~~ frequency at the  
16 facility do power outages occur?

17          THE WITNESS: They happen quite often. Power  
18 outages or power hits. It's very common.

19          MR. WENTWORTH: And when you lose commercial  
20 power, what happens? Do you have back-up capability?

21          THE WITNESS: We have several different  
22 backup capabilities. Different components that we have  
23 has battery pack. We have a UPS system connected to  
24 several items in the tower. And the whole tower is on  
25 a generator back-up that is automatic. As soon as it -

1       - we lose power that starts up.

2               MR. WENTWORTH: Within the facility who  
3 checks the tower clocks, the digital clocks?

4               THE WITNESS: The FAA AF.

5               MR. WENTWORTH: And how often is that  
6 conducted?

7               THE WITNESS: My understanding is it's done  
8 weekly.

9               MR. WENTWORTH: Is there a log to that  
10 effect?

11              THE WITNESS: Ask me that again?

12              MR. WENTWORTH: Is there a log kept to that  
13 effect that -- that -- that the check is made?

14              THE WITNESS: I don't know.

15              MR. WENTWORTH: Do you know from where the  
16 time source is derived?

17              THE WITNESS: Yes, sir.

18              MR. WENTWORTH: Can you tell me what that is?

19              THE WITNESS: It would either be from WWVH in  
20 Hawaii or the GPS clock from Guam Center.

21              MR. WENTWORTH: Who owns the equipment in the  
22 tower cab?

23              THE WITNESS: The FAA.

24              MR. WENTWORTH: And they're responsible for  
25 making sure that it operates correctly?

1 THE WITNESS: Yes, sir.

2 MR. WENTWORTH: About what time were you  
3 notified of this accident? Do you recall?

4 THE WITNESS: Ask me that again?

5 MR. WENTWORTH: About ~~wh~~ time were you  
6 notified of the accident?

7 THE WITNESS: Approximately 2:00 in the  
8 morning.

9 MR. WENTWORTH: And who were you notified by?

10 THE WITNESS: Mr. Theobald.

11 MR. WENTWORTH: And approximately how long  
12 did it take you to get to the facility?

13 THE WITNESS: Approximately 25 minutes.

14 MR. WENTWORTH: And what was going on at the  
15 tower cab when you arrived?

16 THE WITNESS: Mr. Theobald was busy working  
17 traffic. I can't recall exactly what type of traffic,  
18 but I know he was active at the time.

19 MR. WENTWORTH: Did you assist with any of  
20 the notifications?

21 THE WITNESS: I called -- yes, I verified  
22 that some people had been notified. I called CERAP to  
23 see if there was anything that they needed me to do,  
24 and then I went on from there and notified my company.

1           MR. WENTWORTH: Have any changes to  
2 procedures been made or are anticipated?

3           THE WITNESS: We've made an additional to our  
4 tape. When we change our tapes in the morning we do  
5 tape checks. With that we've added where we would tell  
6 the time that it is when we do it. That is with the  
7 crash phone, and that's at the request of the ramp  
8 control supervisor and airport rescue and fire-fighting  
9 -- fire chief to help them until they can come up with  
10 further procedures for times.

11          MR. WENTWORTH: Is there any procedure for  
12 the controller to call an entity other than the Airport  
13 Authority or the crash/fire/rescue station on the  
14 airport in the event of an off-base or off-airport  
15 accident?

16          THE WITNESS: No, sir. The procedure is the  
17 same.

18          MR. WENTWORTH: I have no further questions.  
19 Thank you.

20          CHAIRMAN FRANCIS: KCAB?

21          MR. LEE: Thank you, Chairman.

22               (The following is a verbatim transcript of  
23 the English translation of Mr. Lee's questions posed in  
24 Korean and Ms. Ewert's responses in English.)

1           MR. LEE: Let me just ascertain two things.  
2   As of now do you -- staff size at your control center,  
3   Agana Control Tower -- to think it's appropriate staff  
4   size the contract between FAA and the Barton Company.  
5   If we have a chance to review the contract, would we be  
6   able to find out the staff size of the controller?

7           THE WITNESS: I -- that question. Can you  
8   please restate it?

9           MR. LEE: Yes, with respect to the operation  
10   of the control tower at the Guam Airport, I believe  
11   there is a contract with the FAA. What I'm wondering  
12   is the way there the size of the controller staff is  
13   also included under the provisions of the contract.

14          THE WITNESS: My understanding that it is.

15          MR. LEE: My understanding is that judging by  
16   reading of the report, it says that the staff size is  
17   supposed to be seven, including the witness and the six  
18   others. One is -- I believe one is missing. So,  
19   currently, five people are staffing the duty around the  
20   clock. Don't you think you don't have a sufficient  
21   manpower?

22          THE WITNESS: I'm not sure I understand the  
23   statement. The question was do I have sufficient  
24   manpower. Yes, I do. The statement before that I'm  
25   not understanding completely.

1           MR. LEE: I'm looking at the report, the  
2     Barton Company as of January 1997. It was taken over  
3     by Circor Company. I believe it is in the process of  
4     being taken over. Is there still an ongoing process,  
5     the company -- Barton Company taken over by this Circor  
6     or has it been completed?

7           THE WITNESS: It's been completed.

8           MR. LEE: Let me ask you just one more  
9     question. Just now you mentioned or Mr. Theobald the  
10    controller said that whether the outer mark -- marks  
11    were working or not can be done through report from a  
12    pilot or FAA notification. Like, in this -- in this  
13    fashion, whether certain increment at the control tower  
14    navigation aids are not under continuous monitoring it  
15    cannot be confirmed on a constant basis. Would you  
16    think that it is normal?

17          THE WITNESS: I don't completely understand  
18    your question. The outer marker is not monitored from  
19    the tower.

20          MR. LEE: That the outer marks are in such a  
21    state as not to be monitored by the tower, considering  
22    the outer marker may not be working at any moment until  
23    you receive a report from the pilot, do you think it's  
24    normal to resort to ILS landing clearance?

1 THE WITNESS: I'm sorry, sir. I'm still not  
2 understanding the question.

3 (Pause)

4 MR. LEE: Outer marks whether they are  
5 working or not, the way it can be done is that when it  
6 is not working then you have to receive reports from  
7 the pilot or you can depend upon regular feedback from  
8 the FAA. I believe those are only the two methods, two  
9 ways of confirming whether outer marks are working or  
10 not. Under such a circumstances at the control tower  
11 when you have to clear the aircraft to land, let's say  
12 when the outer marks are not working but you would  
13 still clear ILS approach or a localizer approach? In  
14 other words, I believe you should have at your control  
15 tower something you can use to confirm whether outer  
16 marks are working or not. That's the point of my  
17 question.

18 THE WITNESS: Sir, we don't clear 'em for ILS  
19 approaches. That's done by Guam CERAP. We only clear  
20 them to land after they have their clearance for the  
21 approach.

22 MR. LEE: Okay. Thank you very much. That's  
23 all.

24 (End of translation)

1 CHAIRMAN FRANCIS: Government of Guam?

2 MR. DERVISH: Yes, thank you.

3 Just one quick question regarding  
4 notification. There was a airport crash exercise in  
5 April of '97, I believe the last one they had. Are the  
6 controllers normally part of those exercises,  
7 especially in relationship to notification?

8 THE WITNESS: Yes.

9 MR. DERVISH: Okay. Thank you, Sherrie.

10 CHAIRMAN FRANCIS: Korean Air?

11

12

13 (The following is a verbatim transcript of  
14 the English translation of Captain Kim's response in  
15 Korean.)

16 CAPTAIN KIM: No questions from Korean Air.

17 (End translation)

18 CHAIRMAN FRANCIS: NATCA?

19 (Pause)

20 MR. MOTE: -- you asked NATCA, Mr. Chairman.

21 I didn't hear that. We have no questions. Thank you.

22 CHAIRMAN FRANCIS: FAA?

23 MR. DONNER: We have no questions, Mr.

24 Chairman.

1 CHAIRMAN FRANCIS: Boeing Company?

2 MR. DARCY: Mr. Chairman, no questions.

3 CHAIRMAN FRANCIS: Barton ATC?

4 MR. E. MONTGOMERY: No questions, Mr.  
5 Chairman.

6 CHAIRMAN FRANCIS: Thank you very much for  
7 your help.

8 (Pause)

9 CHAIRMAN FRANCIS: Oh, I'm sorry. I missed  
10 this group of people that is surrounding me up here. I  
11 -- I could tell that you were enjoying yourselves so  
12 much that -- okay.

13 Greg, I'm sorry.

14 MR. FEITH: Just one question. Sherrie, can  
15 you tell me since the accident, is there now any  
16 procedures in place for the controllers if they believe  
17 an accident to have occurred off the airport to go down  
18 the notification list like they have for on-airport  
19 accidents getting off-airport emergency services  
20 involved?

21 THE WITNESS: The procedure is the same that  
22 we have.

23 MR. FEITH: Would you just run through it  
24 real quick for me, please?

1           THE WITNESS: The procedure is to activate  
2 the crash phone. On the crash phone is Guam  
3 International Airport Ramp Control. They have the list  
4 of people that they notify. Also on the crash phone is  
5 the Airport Rescue and Fire-fighting. In addition to  
6 activating the crash phone we would also notify Center  
7 and weather personnel, and then we would go on from  
8 there with our -- our notification list that we have.  
9 But the procedures are the same on and off.

10           MR. FEITH: But if you notified the on-  
11 airport crash/fire/rescue personnel and it's an off-  
12 airport accident, how are you -- how is it ensured that  
13 the notification is being made to off-airport emergency  
14 response units?

15           THE WITNESS: We don't ensure that. The  
16 procedure is set up with the ramp control and then  
17 CERAP.

18           MR. FEITH: Okay. Thank you.

19           CHAIRMAN FRANCIS: Monty?

20           MR. M. MONTGOMERY: I ~~have~~ no questions.  
21 Thank you.

22           CHAIRMAN FRANCIS: Ron?

23           MR. SCHLEEDE: Yes, thank you. I have a  
24 couple regarding the D-BRITE.

1 I'm not sure we asked you what -- for a fully  
2 certified, fully operational D-BRITE what does the  
3 local controller use it for. How is it used?

4 THE WITNESS: Yes, sir. That was asked --  
5 asked, and it was basically the extension of the eyes,  
6 an aid to the aircraft -- I mean to the controller.

7 MR. SCHLEEDE: Okay. If I could ask you  
8 then, under the circumstances of Flight 801, a dark  
9 night with instrument conditions on the final approach,  
10 could you tell us how a controller would -- when he  
11 would look at it, when a controller would use the D-  
12 BRITE during an approach like that?

13 THE WITNESS: He would use it when he got the  
14 information initially with the in-bound -- with the --  
15 when he was passed the information. Like, on this  
16 particular instance, 12-west, there -- the controller  
17 would look on the scope for 12-west -- 12-west,  
18 correlate it, look out the window, and see if he could  
19 see him at that point, and then follow him generally  
20 in, look in the win -- out the window, and if he can't  
21 see it look back to the scope to try to have -- to  
22 correlate it back and forth.

23 MR. SCHLEEDE: And when the controller looks  
24 at the D-BRITE on the scope, what in general is he  
25 looking for? A position or altitude?

1 THE WITNESS: Position, generally.

2 MR. SCHLEEDE: Do they look at the altitude  
3 block? Is it a procedure to look at the altitude  
4 block?

5 THE WITNESS: They could.

6 MR. SCHLEEDE: They -- I'm sorry?

7 THE WITNESS: They could.

8 MR. SCHLEEDE: Okay. But is it a standard  
9 practice that they would not only look at the -- the  
10 general position but the aircraft's altitude in  
11 relation to the approach path?

12 THE WITNESS: They would look at the  
13 position. Then, if they couldn't see the aircraft then  
14 I would imagine they would look at the altitude to see  
15 if he was, like, higher or lower than what he expected  
16 him to be.

17 MR. SCHLEEDE: Okay. Thank you very much.

18 CHAIRMAN FRANCIS: Ben?

19 MR. BERMAN: Ms. Ewert, the Safety Board  
20 issued a recommendation to the FAA in December of 1996  
21 that was on a slightly different subject but covered  
22 the issue of notification -- post-accident  
23 notification, and in -- in March of 1997 the FAA wrote  
24 to us and said that it would direct regional air  
25 traffic division managers to ensure that actions were

1 taken to ensure that Order 7210.4 was reviewed and  
2 managers would review reference materials, procedures,  
3 and letters of agreement to ensure that all emergency  
4 notification telephone numbers are available and  
5 current, including those for crash, fire, and rescue  
6 operations.

7 Facility managers should notify -- should --  
8 correction. Facility managers should forward the date  
9 of completion of the above actions to headquarters air  
10 traffic service through division managers no later than  
11 March 26th of 1997.

12 Was the contract control tower at Guam  
13 included in this program?

14 THE WITNESS: I don't recall that.

15 MR. BERMAN: You have no -- no word of this  
16 at all?

17 THE WITNESS: Not that I remember.

18 MR. BERMAN: Okay. Thank you.

19 MR. CARISEO: One quick question. You had  
20 mentioned that D-BRITE was expected to be commissioned  
21 the end of this month or early April. What was the  
22 original schedule for that to happen, or was there one?

23 THE WITNESS: The original I'm not sure.  
24 We've had several dates throughout the time frame.

1 MR. CARISEO: And what was the earliest date  
2 that you recall?

3 THE WITNESS: The earliest I can remember is  
4 December of '97.

5 MR. CARISEO: Okay. Thank you.

6 CHAIRMAN FRANCIS: I think now you can leave.  
7 Thanks very much. And with you, as the others, if --  
8 if you have to leave --

9 THE WITNESS: Thank you.

10 CHAIRMAN FRANCIS: -- you may. And we  
11 appreciate what you've contributed.

12 (Whereupon, the witness was excused.)

13 CHAIRMAN FRANCIS: I think we'll have --  
14 we've got one more witness, I think, before lunch.  
15 It's 12:15, 12:20. Maybe we'll ask Mr. Thomas Howell,  
16 acting manager, National Field Support Division, FAA  
17 Technical Center, please.  
18 Whereupon,

19 THOMAS HOWELL  
20 was called as a witness, and first having been duly  
21 sworn, was examined and testified as follows:

22 CHAIRMAN FRANCIS: I think that we'll change  
23 here. Apparently this is going to be considerably  
24 longer than -- than the other witnesses have been. And  
25 given that it's -- it's after 12, I think we'll have

1 lunch now. And why don't we reconvene here at 1:30.  
2 It's 12:25 now, so please everybody be back promptly at  
3 1:30.

4 (Whereupon, at 12:25 p.m., the proceedings  
5 were adjourned for lunch, to reconvene at 1:30 p.m.,  
6 the same day.)

17 P R O C E E D I N G S

18 1:30 p.m.

19 CHAIRMAN FRANCIS: All right. We're going to  
20 start again. And Mr. Schleede has the floor.  
21 Whereupon,

22 THOMAS HOWELL

23 having previously been duly sworn, was recalled as a  
24 witness and was examined and testified as follows:

1 TESTIMONY OF  
2 THOMAS HOWELL  
3 ACTING MANAGER  
4 NATIONAL FIELD SUPPORT DIVISION, AOS-600  
5 FAA TECHNICAL CENTER  
6 ATLANTIC CITY, NEW JERSEY

7 MR. SCHLEEDE: Mr. Howell, please give us  
8 your full name and business address for our record?

9 THE WITNESS: My name is Thomas B. Howell.  
10 My address is FAA, Operational Support Service, AOS-  
11 600, in care of the William J. Hughes Technical Center,  
12 Atlantic City International Airport, Atlantic City, New  
13 Jersey.

14 MR. SCHLEEDE: And what is your present  
15 position with the FAA?

16 THE WITNESS: My present position is manager  
17 of the National Field Support Division, AOS-600.

18 MR. SCHLEEDE: Please give us a brief summary  
19 of your training, education, and experience that brings  
20 you to your present position? And please try to pause  
21 slightly between the sentences.

22 THE WITNESS: I've been with the FAA since  
23 1967. In 1973 I was trained as an en route automation  
24 specialist. And the next 20 years I spent either in en  
25 route automation specialty functions or management

1 functions and operational -- functions in the air  
2 traffic environment.

3 My last air traffic position in 1993 was  
4 manager of the Cleveland Air Route Traffic Control  
5 Center.

6 I spent one year detail as a deputy director  
7 in the Operational Support Service in Washington, D.C.

8 Since then I've been in the Engineering  
9 Services Division, AOS-600. Our mission as it regards  
10 to this hearing is to provide centralized software  
11 support for the automated radar terminal systems that  
12 have the automated radar tracking system, the ARTS  
13 system. We receive requirements from those field  
14 facilities, interpret those requirements into software  
15 language that we call adaptation, deliver the product  
16 back to the field for implementation.

17 MR. SCHLEEDE: Thank you. Mr. Dunham will  
18 begin the questioning, and Mr. Pereira will also have  
19 questions from this witness.

20 Oh, I'm sorry. The reverse.

21 MR. PEREIRA: Good afternoon, Mr. Howell.

22 THE WITNESS: Good afternoon.

23 MR. PEREIRA: Would you please describe the  
24 FAA's Minimum Safe Altitude Warning program, also known  
25 as the MSAW program, including information about when

1 and why MSAW was developed?

2 THE WITNESS: Yes. I -- well, I have  
3 prepared a presentation. If I can begin now?

4 MR. PEREIRA: Please.

5 MR. SCHLEEDE: This is coming from what  
6 exhibit? 13?

7 MR. PEREIRA: 13 D, Delta.

8 MR. SCHLEEDE: Thank you.

9 MR. PEREIRA: Actually, this is 3FF, Foxtrot  
10 Foxtrot.

11 THE WITNESS: What I intend to talk about  
12 this afternoon is an overview of the Minimum Safe  
13 Altitude Warning system, the purpose that it was  
14 designed for, an overview of the history as to why it  
15 was developed, a brief description of how it functions,  
16 and steps that we have taken to optimize its  
17 performance and maintenance.

18 The Minimum Safe Altitude Warning is a  
19 function designed solely as a controller aid in  
20 detecting potentially unsafe aircraft proximity to  
21 terrain or obstructions. It generates an alert to the  
22 controller when a pilot is below or is predicted to be  
23 low -- below a specified altitude.

24 These alerts are generated in two forms: a  
25 visual alert that will be displayed to the controller

1 as a -- a L -- flashing LA in the data block or -- I  
2 should say and an oral alert. The oral alert is much  
3 like a smoke detector type of alert.

4 It must be specifically adapted at each one  
5 of our 193 Automated Radar Terminal Systems. Each site  
6 around the country and in the Pacific and -- and  
7 Caribbean that use the Automated Radar Tracking System  
8 has special site tripography that has to be included in  
9 the adaptation, a local database. Each one of these  
10 systems has various amounts and different types of  
11 runways, different approaches, different NAV/AIDs,  
12 different location of those NAV/AIDs, different numbers  
13 and types of airports as well as unique air space  
14 requirements that causes each site to be adapted  
15 uniquely.

16 MSAW came about as a result of National  
17 Transportation Safety recommendation A73-46. This  
18 resulted from an accident December 12th, 1972, Eastern  
19 Airlines 1011 in Miami, Florida. Specifically, the  
20 NTSB requested the FAA to review ARTS III program for  
21 the possible development of procedures to aid flight  
22 crews when marked deviations in altitude are noticed by  
23 ATC, air traffic control.

24 In December of 1973 the FAA contracted with  
25 Univac to develop hardware and software modifications

1 necessary to implement this recommendation.

2 In 1977 MSAW was implemented into the ARTS  
3 III program, and in 1990 into the ARTS IIA program.  
4 Additionally, we have installed this function into the  
5 EARTS system and the en route environment.

6 Though there are several different types of  
7 MSAW processing, today we're going to focus -- this  
8 briefing or presentation will focus primarily on the  
9 terminal processing. In the terminal environment there  
10 are two different types of processing that we'll talk  
11 about. One is general terrain warning and the other is  
12 approach path monitoring.

13 However, both of these types of processing  
14 require certain things to be present before the  
15 aircraft will be eligible for MSAW processing. It must  
16 be a tracked target. That is, a flight plan must be  
17 entered into the system. It must have a valid mode C  
18 or altitude reporting. It must be within the adapted  
19 eligibility area. It must be outside any inhibit  
20 zones. It also must be in a proper flight status, and  
21 by that it's to be -- to receive arrival processing it  
22 has to be listed as an arrival in the flight plan.

23 It also has to have a proper beacon code  
24 assignment because there are some areas where we would  
25 intentionally inhibit flights from receiving or being

1 eligible to receive MSAW processing. Those might be  
2 cases of military operations, helicopter operations,  
3 special VFR operations.

4 In the area of general terrain monitoring  
5 we've got three different types of alerts or alarms  
6 that may be presented to the controller. The first one  
7 would be the current alarm. Any time an aircraft is  
8 presently less than 500 feet above the digital terrain  
9 map it will automatically generate an alarm.

10 We also have prediction alarms. When the  
11 pilot would be less than 500 feet above the digital  
12 terrain map within 30 seconds -- in advance of the  
13 flight course within 30 seconds of the flight  
14 trajectory.

15 We also provide a third type of alarm called  
16 a projection alarm. If the pilot will be unable to  
17 clear all obstacles within eight minutes flying time on  
18 present course at a five degree climb angle.

19 Before I explain more about those particular  
20 alarms, I'd like to briefly mention about what digital  
21 terrain maps are. The -- to MSAW processing. The  
22 graph that's up on the -- screen is a -- a small sample  
23 of a digital terrain map, and each one of our radar  
24 sensors that is used in the automated -- in the ARTS  
25 system will have a digital terrain map built for it.

1     So, each sensor -- and we have some of our systems that  
2     have multiple -- multiple sensors, but the important  
3     thing is that each sensor will have one of these  
4     individually built for it.

5             And each one of these maps consist of 4096  
6     two-nautical-mile bins. And the bin altitudes are  
7     expressed in feet. This data is provided and certified  
8     by NOAA. NOAA gets this data and builds these maps  
9     with data from the National Imagery and Mapping Agency  
10    and the coast -- the U.S. Geological Survey. They  
11    build the terrain maps.

12            To these terrain maps NOAA adds the obstacle  
13    obstruction layer which will determine the highest  
14    obstruction within that two-mile bin.

15            And I'll just point to one of the bins here.

16     Hopefully you can see that. This bin says 333. Well,  
17     that means that that bin -- highest obstruction in that  
18     bin is 333 feet mean -- sea level.

19            Now, our software will add 500 feet to that  
20    bin for processing purposes. So, if the aircraft is  
21    projected to be within 833 feet we'll generate an alert  
22    to the controller.

23            Each one of these -- I -- I need to back up  
24    and correct that statement. We -- we actually round  
25    off these bins to the nearest hundred feet, the nearest

1 highest 100 feet. So, in that case that bin would go  
2 up to 400 feet. That's an important point to notice.  
3 We round those bins up to 100 feet and then we add the  
4 500-foot buffer to that in the software.

5 Now, back -- back to the -- the different  
6 types of alarms. Remember, we had three different  
7 types of alarm. We have the current alarm which will  
8 generate an immediate alert, all right.

9 On Point A as used to -- to show a  
10 projection, all our aircraft are continually projected  
11 30 -- 30 seconds in advance of its trajectory. If in  
12 that -- anywhere along that 30-second route if it's  
13 projected to be in a bin below that altitude, the  
14 projected trajectory of the aircraft, the alert will be  
15 sounded.

16 Now, there are some exceptions to that.  
17 Generally, it will take two consecutive predictions to  
18 generate the alert to the controller. Two consecutive  
19 projections 30 seconds in advance will generate a alert  
20 to the controller. In the MSAW -- terminal MSAW  
21 environment we're dealing with 4.75-second radar, so  
22 the scan rate is every 4.75 seconds. The projection 30  
23 seconds. Any two consecutive hits will generate an  
24 alert to the controller.

1           Now, we have a -- I'm sorry. That's a --  
2 prediction.

3           We also from that Point A on the screen we  
4 have another -- this is almost a separate type of  
5 projection. From that point we are constantly  
6 projecting eight minutes in the future at a five degree  
7 climb angle to make sure that the aircraft can clear  
8 any obstacles in its path.

9           So, we've got two things going on here. The  
10 projection point is continually updated every 4.75  
11 seconds, and from that Projection Point A we're  
12 continually projecting 480 seconds into the future at a  
13 five degree climb angle to make sure the aircraft can  
14 clear any obstacles within its path. If any two scans  
15 detect an altitude bin encroachment, we will generate  
16 an alert to the controller.

17           The next area of MSAW alert processing is the  
18 approach path monitor. Again, any current violations  
19 of the air space will provide an alert to the  
20 controller. On the prediction the pilot is projected  
21 to be 100 feet below the calculated approach path alarm  
22 slope altitude within the next 15 seconds.

23           Approach path monitors are used to transition  
24 aircraft from general terrain monitoring to the  
25 airport. These approach path monitor boxes are

1 generally one mile either side of runway center line.  
2 They initiate generally five miles from the end of the  
3 runway. They generally will terminate within one mile  
4 of the runway. The initiate altitude for the slope  
5 will be based upon the D -- the -- the DTM at the  
6 initiate point plus 500 feet. The cut-off altitude  
7 will be based on any obstructions or the MDA. And  
8 we're -- for this purposes, if there's obstructions we  
9 will use the MDA minus 100 feet for the lowest non-  
10 precision approach for that runway.

11 It comes into the airport inhibit area, which  
12 is normally within one mile of the airport. At some  
13 point you have to stop this processing 'cause  
14 eventually everybody, we hope, is going to land  
15 successfully. So, anything within one mile we find  
16 generates a tremendous amount of nuisance alerts.

17 Also, that's generally the point where we  
18 stop tracking and we have our -- our drop track  
19 parameter for the -- the system. And we also terminate  
20 any alert processing.

21 Now, I'd like to show you a picture of the  
22 Guam adaptation prior to the accident. You will notice  
23 the outside ring is a 60-mile ring around the radar  
24 antenna. Inside that -- that ring -- there's actually  
25 a double line -- a double ring there, and it may be

1     difficult for you to see that, but there's actually a  
2     double ring there. That's only one mile apart.

3             Processing in this case was enabled between  
4     54 and 55 miles from the radar antenna, effectively  
5     inhibited processing within 54 miles of the airport.  
6     It also inhibited any approach path monitoring  
7     processing. In this situation there were no oral or  
8     visual alarms generated within that circle. This  
9     resulted from a facility request and has been  
10    operational in that condition, as far as we can  
11    determine, since February of 1995.

12            After the accident we had some -- we were on  
13    the phone with the folks at -- in Guam two days later  
14    to go over what was in the system and we had dispatched  
15    some people out there the following Monday. I -- I  
16    don't have the exact date, but I think it was in a  
17    couple days they had readapted the system. We had  
18    removed that double line, enabled the processing within  
19    55 miles, optimized the approach capture boxes, reduced  
20    the size of the departure inhibit areas, expanded the  
21    airport eligibility, and we are still presently working  
22    on trying to eliminate nuisance alerts.

23            We've learned a lot from this. As a result  
24    of -- of this and several other accidents, on October  
25    the 3rd, 1990 --

1 MR. PEREIRA: Mr. Howell?

2 THE WITNESS: Yes?

3 MR. PEREIRA: Can I stop you there before we  
4 get into the -- the changes after the fact and the  
5 review process? Could we go over some questions first,  
6 if you don't mind?

7 THE WITNESS: Yes, sir.

8 MR. PEREIRA: Okay. Thank you.

9 (Pause)

10 MR. PEREIRA: What kind of MSAW systems were  
11 in place at the Guam ATC facility at the time of the  
12 accident? You had mentioned we had ARTS and EARTS.  
13 You mentioned a couple different types of MSAWs. What  
14 -- what was in place at Guam at the time of the  
15 accident?

16 THE WITNESS: At the time of the -- the  
17 accident the ARTS IIA system was being used for the  
18 terminal approach services and the micro-EARTS was  
19 being used for the en route environment.

20 Micro -- I'm sorry.

21 MR. PEREIRA: It's okay. Could you -- you  
22 mentioned the fact that we had a eligibility area  
23 problem on the ARTS MSAW. Was the EARTS functioning  
24 properly or was it configured properly?

1 THE WITNESS: Yes, as far as I can tell it  
2 was.

3 MR. PEREIRA: Okay. And did we get any EARTS  
4 MSAW alarms for the Korean 801 accident airplane?

5 THE WITNESS: Yes, we did. We received one  
6 -- one alert that was displayed.

7 MR. PEREIRA: Okay. Teddy, could you put up  
8 Exhibit 3EE, page two?

9 (Pause)

10 MR. PEREIRA: And at the bottom of this page  
11 here we have the EARTS output?

12 THE WITNESS: Yes, that's correct.

13 MR. PEREIRA: Would you explain the date on  
14 this page and what they show regarding the EARTS MSAW  
15 processing and the radar scope warnings for KA 801?

16 THE WITNESS: Yes. At time 15:41:08 there  
17 was a projection alert, a software projection  
18 calculated for Korean 801. It was a general terrain  
19 warning prediction. As I've also mentioned in the --  
20 the prediction for the ARTS IIA program, this is the  
21 same thing that it's going to take two predictions to  
22 generate an alert to the controller. We had one  
23 predicted alert at 15:41:08. Since there was not  
24 another alert it did not display to the controller.

1           However, on 15:42:20 there was a -- an actual  
2 alarm in the approach path monitor area. Now, as I --  
3 as I stated before, any actual penetrations will  
4 generate an immediate alert. So, the one alert that  
5 was generated was 15:42:20 on the Korean 801. I know  
6 that there was some confusion around this earlier.

7           Now, that -- the alert itself is the next --  
8 the last two lines. The MA stands for the MSAW alert  
9 that was generated, as you can see, at 15:42:20 for the  
10 KAL 802. And that was for the approach path warning.

11           MR. PEREIRA: Okay. Thank you very much.

12           You mentioned the ARTS II MSAW eligibility  
13 area had been set to a ring, and you showed a graphic  
14 of that. When was that -- actually, I think you  
15 already answered that. That was the February '95 date  
16 of that change, is that correct?

17           THE WITNESS: Yes, it had the two -- the one-  
18 mile ring that was enabled from 54 miles to 55 miles  
19 and then as far as we can tell was in operation since  
20 February of '95.

21           MR. PEREIRA: Can you explain why the  
22 eligibility area was set as it was and who requested  
23 and approved these changes relative to the prior  
24 status?

1           THE WITNESS: I -- I cannot speak to why it  
2 was set that way or what the thought processes were.  
3 However, it -- up -- at that time local facilities had  
4 -- there was no -- no -- national policy in place that  
5 would prohibit a facility from doing that. So it was  
6 left to the discretion of the local facilities.

7           MR. PEREIRA: Did they physically make that  
8 change in the software there or was it made back at the  
9 tech center?

10          THE WITNESS: That was part of a -- some data  
11 that was sent to us the previous fall for -- it was  
12 called a site adaptation kit where they fill out a form  
13 to describe what their local site environment should  
14 be, and we translate that and build a new program and  
15 send it out to them. And I think we received the data  
16 some time in the fall of '94 and that software package  
17 was installed -- it was a new upgrade -- was installed  
18 in February of '95.

19          MR. PEREIRA: Okay. So that process was in  
20 place -- that was in place at the time, at this point  
21 do you feel that that was appropriate to maintain a  
22 proper configuration of the MSAW system? The process  
23 that was in place for requesting and -- and -- and  
24 carrying out the changes to the MSAW. What's your  
25 opinion on the adequacy of that at the time?

1           THE WITNESS: I really can't speak for the  
2     appropriateness of it, but what I can tell you now in  
3     this environment, we have taken steps to see that we're  
4     going to do business in a different manner and that  
5     we're not going to do that anymore. And we've actually  
6     designated these type of parameters to be the  
7     responsibility of one organization, the AOS  
8     organization, that organization that I work for.

9           MR. PEREIRA: After this accident the FAA  
10    performed a simulation of the Guam ARTS IIA MSAW  
11    performance, the one that had the eligibility ring.  
12    With the eligibility ring removed and in its proper  
13    configuration using the Korean Air 801 radar data,  
14    would you please describe the simulation further and  
15    the results of that simulation?

16          THE WITNESS: Yes. We do not have the  
17    ability to record the ARTS IIA data. We do have the  
18    ability to record the Micro-EARTS data. And the Micro-  
19    EARTS uses a 12-second radar versus the -- the terminal  
20    radar using 4.75. So, we took the data from the 12-  
21    second radar and we -- put it into a test target  
22    generator and extrapolated the 12-second returns on the  
23    flight that we had -- the information that we had for  
24    the Korean 801 and fed it into the ARTS IIA program  
25    through the simulator.

1           And it did show that approximately at 1700  
2   feet it would have generated an alarm and it went on  
3   for approximately 60 seconds prior to impact -- or  
4   prior -- prior to coasting.

5           MR. PEREIRA:   Okay.   So, the simulation  
6   showed approximately 60 seconds of continual message on  
7   the radar scope, is that correct?

8           THE WITNESS:   Yes, being -- through the  
9   simulation it did show that.

10          MR. PEREIRA:   Okay.   Thank you.

11          THE WITNESS:   Any other questions on the  
12   displays before or after?

13          MR. PEREIRA:   No, I think that does it for  
14   me.   Mr. Dunham has some questions for you now.

15          MR. DUNHAM:   You can go ahead and resume your  
16   briefing, and then I will -- I may ask you a question  
17   after each slide.

18          THE WITNESS:   Okay.

19                 October 3rd, 1997, FAA established a method  
20   for strict configuration management of MSAW.   All  
21   modifications are now centrally maintained.   We've  
22   described -- established strict management oversight of  
23   these parameters.   We've developed guidelines and a  
24   review process of quality assurance of how we're going  
25   to manage this.

1           As I mentioned before, each site prior to the  
2   -- that date had the authority to make changes to MSAW.

3   Unfortunately, they had limited guidance on how to  
4   make those changes. AOS is now the only organization  
5   authorized to make changes to this program, the MSAW  
6   program.

7           We have developed common MSAW adaptation  
8   standards for all terminal systems. Additionally,  
9   those facilities that we find cannot fit into these  
10  standards go through a comprehensive waiver review  
11  process at the national or Washington level.

12          I'd like to spend a little bit more talk  
13  about this optimization process and steps that we've  
14  taken since October the 3rd. We've assembled or we did  
15  assemble an interdisciplinary team, chose -- recognize  
16  AT and AF experts to develop standards for clear  
17  guidance on how to adapt this MSAW.

18          Prior to that time, the local facilities were  
19  left with just a guidance of -- of adapting it. An --  
20  an example might be there -- when they're told how to  
21  adapt an eligibility area it could be zero to 60 miles.

22   Now we have developed a standard and said that it's  
23  got to be a minimum of five miles beyond your approach  
24  air space. It can't be any -- and it's got to -- it  
25  can't -- it's got to start at the airport. So, we've

1 really nailed down the standards and we've -- we've  
2 testified some nominal values, and if they deviate from  
3 those nominal values it's going to require a waiver.

4           The initial optimization, we set up a review  
5 process to gather all the data. We actually went out  
6 and copied all the operational programs in the system  
7 and put a team together to review what was actually in  
8 the -- the data and the systems. And we developed some  
9 tools that would allow us to -- to graphically or -- or  
10 -- or put this data -- software data into a picture.  
11 So, we go by -- to it and review it and prioritize what  
12 need to be done. And then set up a work process to  
13 start the review.

14           And each -- each review process was done by  
15 two people and then checked by another two people and  
16 then sent to a different organization for a quality  
17 review process. And if any errors were found it would  
18 stop -- back -- start back in the beginning of the --  
19 the review process.

20           We also, as I mentioned previously, developed  
21 tools to take the program listings and develop it into  
22 pictures. That's a real quick way to see what's going  
23 on. Unfortunately, had these kind of tools been in the  
24 field at the time it would have been probably a  
25 different story.

1           However, technology has just recently allowed  
2       us to do this kind of stuff. We've applied new  
3       standards to each site. Additionally, we've --  
4       developed and tested site-specific test scenarios for  
5       each site for functional verification. So now our  
6       technicians, when they do certify these systems,  
7       they've got a test scenario to run that would produce  
8       hard copy results.

9           MR. DUNHAM: Okay. Can you talk a little bit  
10      about those tools? The two slides previously that  
11      showed the illustration of the Guam adaptation, those  
12      were created with those tools?

13           THE WITNESS: That's correct.

14           MR. DUNHAM: Okay. So that's -- that's the  
15      actual data from Guam? That's not a simulation?

16           THE WITNESS: This is the actual data that's  
17      in -- adapted in the Guam system.

18           MR. DUNHAM: Okay.

19           THE WITNESS: Now, I said this was the actual  
20      data as of a couple weeks ago. All right. Now, we've  
21      since -- I'd have to check as to whether this is the  
22      optimized program or not, but it's -- it's definitely  
23      after the accident. And also we're -- as I said, we're  
24      continuing the optimization process of nuisance alerts.

1           MR. DUNHAM: Okay. And was that re-  
2           adaptation, was that flight-checked?

3           THE WITNESS: I don't have that information.

4           MR. DUNHAM: Okay. And which -- what sites  
5           are included in the 193? What types of facilities?

6           THE WITNESS: We have 130 ARTS II sites, ARTS  
7           IIA sites. We've got 60 ARTS IIIA sites, and three  
8           ARTS IIIE sites.

9           MR. DUNHAM: Can you explain the differences  
10          between those facilities?

11          THE WITNESS: Generally, the -- the -- the  
12          IIA system is -- is a basic program. The IIIA system  
13          is a little more sophisticated. It has a little more  
14          functionality. And the IIIE system is -- is kind of a  
15          state-of-the-art solid state advanced system, which  
16          would be more of a -- a land type network system  
17          distributed -- type processing.

18          MR. DUNHAM: Okay.

19          THE WITNESS: Okay.

20          MR. DUNHAM: Thank you.

21          THE WITNESS: Again, the one thing I need to  
22          mention here is that we -- we actually have re-adapted  
23          all of the 193 sites, and that work has been completed.  
24          At least half those sites are operational with the --  
25          the new -- new functionality.

1 MR. DUNHAM: And what does the -- the site-  
2 specific functionality tests actually test?

3 THE WITNESS: It -- it tests the -- it --  
4 it's a random test to see that the software is  
5 generating alerts where it's supposed to, that we're  
6 getting general terrain warning alerts and we're  
7 getting approach path monitor -- alerts. It also tests  
8 conflict alert.

9 MR. DUNHAM: Okay. So that testing is done  
10 on every site before the adaptation is sent out?

11 THE WITNESS: Yes. We test -- we're testing  
12 it at the tech center. But we also send out this --  
13 this scenario and this tape along with the new program  
14 so that the local people can do their own testing, and  
15 they're required to do it on a monthly basis.

16 MR. DUNHAM: All right.

17 THE WITNESS: I'd like to talk about just a -  
18 - a couple of nation wine -- nationwide findings and  
19 fixes that we've uncovered through our investigation of  
20 193 sites.

21 We reduced a significant amount of inhibited  
22 air space. Again, we -- we did not have any specific  
23 standards and we've since developed standards which  
24 require the rebuild of basically all of our sites to  
25 make sure that everybody was in the same conformance

1 and that we can now configuration manage all of these  
2 systems.

3 An example of some new inhibit standards, in  
4 the departure inhibit area we had a range of zero to 50  
5 miles. Now the new standard is two miles from the  
6 airport, maybe up to six depending on local conditions.

7 Anything beyond that would require a waiver.

8 General terrain monitoring didn't have a  
9 standard before. New standard: not to exceed five  
10 miles from the airport.

11 Fly-in inhibit areas didn't have a standard  
12 before. New standard: on defined airports not to  
13 exceed five miles.

14 We redesigned all the approach capture boxes,  
15 -- redefined the initiate and termination points on the  
16 digital terrain maps. Previously it was a manual  
17 effort to update all these altitude bins -- whenever  
18 new obstructions would come in.

19 On alarm -- approach path monitor slope alarm  
20 we've developed guidelines and procedures for what the  
21 initiate altitude should be, also what the cut-off  
22 altitude should be. Before it was left to local --  
23 discretion. Now we've got strict standards.

24 MR. DUNHAM: On the approach slope  
25 adaptation, was that also added to the EARTS system?

1           THE WITNESS: The EARTS system does not have  
2       approach slope adaptation capability. We have  
3       generated a National Transit proposal to incorporate  
4       that. Until that -- that case file is approved, we're  
5       adapting what we call pseudo-capture boxes, all right,  
6       that allow us to, actually like a step-down approach,  
7       step down the approach like a stair -- like a ladder  
8       stair.

9           MR. DUNHAM: Okay. And why would you add  
10      that adaptation to a system that didn't have it  
11      previously?

12          THE WITNESS: Okay. What we found -- our  
13      team in -- in reviewing MSAW and trying to make this as  
14      -- as best as it can be that we -- in the ARTS II  
15      environment there was two methods of adapting approach  
16      box monitors. One was you could adapt a flat plane at  
17      -- at the -- the MDA of the lowest non-precision  
18      approach minus 100 feet below that approach as -- as a  
19      method of adapting approach capture box. Or you could  
20      adapt an approach path monitor slope alarm.

21          Well, we found that it provided much more  
22      accuracy to adapt the slope, and we've incorporated  
23      that as our standard.

24          Now, when we first started this process we --  
25      we did not -- we weren't aware that you could put it in

1 all the systems, and we've since decided to go ahead  
2 and put it in all those systems. And we've developed  
3 some -- some coding modifications and some change  
4 proposals to take action to do that and improve the  
5 performance of the system. So -- and our -- our  
6 standards, I -- I couldn't tell you exactly how many  
7 airports were adapted at the flat plane, but our new  
8 standard is to have the -- the approach path monitor  
9 slope alarm. And we're in the process of incorporating  
10 that nationwide.

11 MR. DUNHAM: And what's the practical effect  
12 of implementing that slope?

13 THE WITNESS: It'll generate alarms sooner.  
14 It'll generate alerts soon -- sooner.

15 MR. DUNHAM: Okay. And just to clarify, the  
16 ARTS IIA system has had that capability longer than the  
17 other systems?

18 THE WITNESS: Yes. ARTS IIA came along in  
19 1990, and if you remember, the IIIA system was 1977.  
20 This was kind of the prototype.

21 MR. DUNHAM: And the -- the IIIA did or did  
22 not have that capability?

23 THE WITNESS: The IIIA -- the IIIA was not  
24 released with that capability. We found that there  
25 were some coding in there that -- that we can modify

1 and give it that capability, and we have since rebuilt  
2 all the IIIA programs with that new capability.

3 MR. DUNHAM: Okay. So, your intention at the  
4 completion of this will be that all the ARTS systems of  
5 any type will have that slope available?

6 THE WITNESS: They will have that slope  
7 available, that's correct. And most of the approaches  
8 will have that slope unless there's a step-down  
9 approach.

10 MR. DUNHAM: Okay. Thank you.

11 (Pause)

12 THE WITNESS: I'd like to spend just a few  
13 minutes to talk about how we're going to maintain this.  
14 We have spent a lot of resources and a lot of time  
15 getting -- gathering all this data and -- and getting  
16 it up to date.

17 CHAIRMAN FRANCIS: Excuse me. Could -- you  
18 talk really fast.

19 THE WITNESS: Okay. I'm sorry.

20 CHAIRMAN FRANCIS: I mean I don't know  
21 whether you're a former controller or not, but I -- I  
22 suspect that these folks in the back of the room are --  
23 having some trouble translating. So, I know it's hard  
24 to sort of think about what you're saying and think  
25 about speaking slowly, but if you can try to keep that

1       --

2               THE WITNESS:   Okay.

3               CHAIRMAN FRANCIS:  -- help that.

4               THE WITNESS:   Thank you.  I'll slow down.

5               We've spent a lot -- lot of time and  
6 resources and efforts in -- in getting this program up-  
7 to-date and -- and optimizing it to make it everything  
8 that we -- we think that it can be.  So, we certainly  
9 don't want to let it fall back in any -- any form of  
10 disrepair.

11              We're going to establish a process where we  
12 can by automation tools build new digital terrain maps  
13 every 28 days.  We've already contracted with -- with  
14 NOAA to put a piece of equipment on line that can  
15 generate these digital terrain maps for us.  And we can  
16 just pull 'em down and -- and compare for any changes,  
17 and if there are any changes we'll just build a whole  
18 new map and send it out to the facility each month.

19              Every year we -- we plan to review every site  
20 -- excuse me.  We also are going to be reviewing every  
21 new and amended standard intimate approach procedure to  
22 check for any obstacles.  Since we've adapted the glide  
23 path concept we have to -- check any changes to those  
24 runways.

1           We're going to conduct yearly site adaptation  
2 review with -- specifically to review these parameters  
3 and make sure these systems are adapted properly.  
4 We'll divide up all 193 sites by 12 and do so many per  
5 month on a review basis annually.

6           Resources and processes are available 24  
7 hours a day. We've got a 24-hour help -- help line.  
8 We're going to establish a team at the tech center.  
9 Their sole function will be to take care of MSAW.  
10 We're going to get experienced field people that work  
11 well in a team environment that are technically  
12 competent and conceptually understand ATC procedures.  
13 We also intend to use modern software technology  
14 practices as much as possible and our requirements --  
15 management project tracking configuration management  
16 and we're going to use peer reviews for a defect  
17 prevention process.

18           MR. DUNHAM: Okay. By your use of the  
19 digital terrain maps from NOAA you've effectively out-  
20 sourced the basis of your adaptation. Have you  
21 satisfied yourself that their processes are suitable to  
22 base your MSAW processing on?

23           THE WITNESS: Yes, we have. I've had a  
24 couple of specialists over there talking with NOAA, and  
25 they're satisfied with the -- the quality control that

1       they're using.

2               MR. DUNHAM:   And will you be looking into  
3       that periodically yourself to make sure that it doesn't  
4       deteriorate over time?

5               THE WITNESS:   Sounds like a good idea.   We'll  
6       put that on the list.

7               MR. DUNHAM:   Okay.

8               (Pause)

9               THE WITNESS:   In summary, we -- we feel this  
10       is very important to our organization.   We've taken  
11       action to centralize the oversight and management of  
12       this program.   We've developed standards and  
13       guidelines.   We've developed new tools.   We've  
14       streamlined the process.   And we're going to  
15       continually look for ways to improve this program.

16               And that concludes my presentation.

17               MR. DUNHAM:   Okay.   Can you back up to the  
18       slide that shows the approach path monitor boxes?

19               (Pause)

20               MR. DUNHAM:   That one.   Could you just go  
21       through that slide and discuss which of those elements  
22       would be considered a user-defined site variable as  
23       MSAW was being managed at the time of the accident?

24               THE WITNESS:   Everything that's on that slide  
25       would be a user-defined variable.   As far as the

1     initiate point of the boxes, the width of the boxes,  
2     the altitudes, whether it was a slope or whether it was  
3     a flat plane, the general terrain maps. The general  
4     terrain maps were originally sent from NOAA but they  
5     required updating. That was also a -- a locally  
6     generated task to update those maps and those bins.  
7     Anytime a bin would change they'd have to calculate  
8     what the new altitude was and then patch it into the  
9     program.

10           The inhibit areas around the airport was  
11     locally generated. Everything on that slide was  
12     locally generated and controlled.

13           MR. DUNHAM: Okay. Thank you.

14           After the accident AOS sent a team to Guam  
15     and you explained what they -- the work they did after  
16     they got there. When was the MSAW system on the ARTS  
17     IIA returned to service after the team had arrived?  
18     Just roughly.

19           THE WITNESS: I don't have the exact date,  
20     but I -- I think it was within five days of their  
21     arrival.

22           MR. DUNHAM: Okay. And how long had the MSAW  
23     been out of service prior to that? That was all the  
24     way back to the February of '95 date?

1           THE WITNESS: Well, technically, I mean it  
2 was processing that one-mile gap, okay, since February  
3 of '95. And until our team arrived there it was just  
4 -- it was still processing that one-mile gap.

5           MR. DUNHAM: Okay.

6           THE WITNESS: Then when they left that --  
7 that first week, then it was processing normally.

8           MR. DUNHAM: Okay. Are you aware of any  
9 problems they may have had with acquiring a digital  
10 terrain map between 1995 and the time of the accident?

11          THE WITNESS: No.

12          MR. DUNHAM: Okay. When the team put in the  
13 revised adaptation, did they have to make any program  
14 changes to the ARTS IIA system?

15          THE WITNESS: Not that I'm aware of.

16          MR. DUNHAM: Okay. So, there was no  
17 technical reason that the adaptation they put in after  
18 the accident could not have been used prior to the  
19 accident?

20          THE WITNESS: Not that I'm aware of.

21          MR. DUNHAM: Are there any inhibited areas in  
22 the current effective latest version of the Guam  
23 adaptation?

24          THE WITNESS: No volume inhibit areas.  
25 There's some departure inhibit areas that are a couple

1 miles from the airport, which is a routine thing.

2 MR. DUNHAM: Okay. But effectively, areas  
3 that are analogous to the 54-mile radius area are no  
4 longer used?

5 THE WITNESS: That's correct.

6 MR. DUNHAM: Okay. Has the CERAP reported  
7 any false alarm problems with the new adaptation?

8 THE WITNESS: Yes, they have.

9 MR. DUNHAM: Okay. What's the process for  
10 analyzing and minimizing the problems from those?

11 THE WITNESS: Along with the -- the release  
12 of the new program tape we've also put in a program  
13 modification that prints out a copy -- hard copy of all  
14 the -- the alerts so that when a site does complain  
15 about false alerts they can -- they can fax the hard  
16 copy to us and we can quickly look at it and find out  
17 where these alerts are being generated.

18 Right now it's my understanding there's a --  
19 a major portion of these alerts at Guam are when the  
20 aircraft are being turned on visual approach and  
21 turning on base lag. We've analyzed that and we think  
22 that we can improve that situation.

23 MR. DUNHAM: So the technical means for  
24 eliminating false alarms have been in the software all  
25 along?

1 THE WITNESS: Could you please repeat that?

2 MR. DUNHAM: The technical means for  
3 eliminating false alarms, the tools you'd use, the --  
4 the functions of the software that you're planning to  
5 use are not new? They've been available since ARTS IIA  
6 was put in?

7 THE WITNESS: Yes and no. The -- some of  
8 these tools have just developed so that we can easily  
9 look at it. Prior to that it was a very cumbersome  
10 process to try and analyze those results.

11 MR. DUNHAM: Okay. But they -- the program  
12 itself has had the capability?

13 THE WITNESS: Yes.

14 MR. DUNHAM: Okay. Given that that  
15 alternative process exists, is there any reason that --  
16 any technical reason that the 54-mile radius inhibit  
17 area was the only alternative available before that?

18 THE WITNESS: Could you restate that  
19 question?

20 MR. DUNHAM: Yeah. At the time of the  
21 accident we had a 54-mile circle of inhibited area at  
22 Guam because of false alarms. There are alternatives  
23 available to that approach, are there not?

24 THE WITNESS: Yes.

1 MR. DUNHAM: Okay.

2 Okay. Teddy, could we have O1 please?

3 For the record, Exhibit O is a briefing that  
4 was presented to NTSB on January 29th, 1998, regarding  
5 the progress of the MSAW review team.

6 (Pause)

7 MR. DUNHAM: And Mr. Howell, is this -- is  
8 this slide inaccurate in any way?

9 (Pause)

10 THE WITNESS: That's correct.

11 MR. DUNHAM: Okay. Thank you very much.

12 Do you feel that adequate resources have been  
13 allocated to the MSAW review to ensure that it's  
14 thorough and complete?

15 THE WITNESS: Yes, I do.

16 MR. DUNHAM: Okay. Have you had any problems  
17 getting support for the effort from FAA?

18 THE WITNESS: No, I haven't.

19 MR. DUNHAM: Okay. What is the level of MSAW  
20 training and expertise required for proper  
21 understanding and management of the software?

22 THE WITNESS: I believe each one of the  
23 automation specialists had received a minimum of eight  
24 hours worth of training in this area along with several  
25 other hours about adaptation. So, it doesn't really --

1       they're receiving adequate training right now.

2               MR. DUNHAM:   Okay.   How about at the time of  
3       the accident?

4               THE WITNESS:   It's also my opinion that they  
5       received adequate training.

6               MR. DUNHAM:   All right.   What were the most  
7       serious problems identified in the -- the review that  
8       your people have found?

9               THE WITNESS:   The -- probably the most  
10       serious were the amount of inhibit areas and how some  
11       of the inhibit areas were adapted.

12              MR. DUNHAM:   And how many sites had that sort  
13       of problem?

14              THE WITNESS:   There was -- was four.

15              MR. DUNHAM:   Okay.   And when will a -- a  
16       final report on the outcome of the review be available?

17              THE WITNESS:   Within 60 days.

18              MR. DUNHAM:   How confident are you that upon  
19       completion of the review MSAW will be properly  
20       configured and managed at all FAA facilities?

21              THE WITNESS:   Very confident.   We plan to use  
22       software engineering institute capability maturity  
23       model processing for the maintenance of this system.

24              MR. DUNHAM:   Okay.   And that's a formal  
25       software management process?

1 THE WITNESS: That's correct.

2 MR. DUNHAM: Okay. Have there been any  
3 changes to the ARTS IIA documentation as a result of  
4 the review?

5 THE WITNESS: Yes, there have. We've  
6 developed new standards.

7 MR. DUNHAM: Okay. Prior to that what level  
8 of detailed guidance was available to the ARTS II  
9 automation specialist? You described it as -- as sort  
10 of general. Can you expand on that?

11 THE WITNESS: No, I -- probably the -- the  
12 best example would be, you know, just how to adapt it,  
13 not what the standard would be. Maybe it would be like  
14 a speed -- knowing that the car can go zero to 100  
15 where are the optimum value, perfect driving range  
16 would be should be 55.

17 So, we've -- in, like, the general terrain  
18 monitor inhibits, it could be any value. It just said  
19 you could adapt from zero to 50 miles. Now we've said  
20 it can't go any farther than five miles away from the  
21 airport. And it must include the air space five miles  
22 outside the approach air space.

23 So, what we're trying to do is -- is to  
24 really have a hard and fast standard.

1 MR. DUNHAM: Okay. And what was the -- the  
2 major difference between the ARTS IIA documentation and  
3 the ARTS IIIA documentation prior to the accident?

4 THE WITNESS: The ARTS IIIA had a little bit  
5 more -- specificity and had some nominal values  
6 suggested in some of their parameters.

7 MR. DUNHAM: Was there any use of the ARTS  
8 IIIA documentation to obtain proper values for ARTS IIA  
9 systems prior to the -- the accident?

10 THE WITNESS: I -- I would say probably  
11 because some of the -- the technicians that developed  
12 the IIA documentation and standards were also trained  
13 in IIIA, so they had experience with IIIA systems.

14 MR. DUNHAM: Is there any technical  
15 difference in the way that inhibit areas are adapted  
16 under ARTS IIIA and under ARTS IIA?

17 THE WITNESS: No. We're applying the same  
18 standard for all airports regardless of the system.

19 MR. DUNHAM: Okay. How about prior to the  
20 accident?

21 THE WITNESS: Yes, there was.

22 MR. DUNHAM: There was a difference between  
23 the two?

24 THE WITNESS: Yes. In -- the main difference  
25 being one system had a standard and the other didn't.

1           MR. DUNHAM: Okay. But as far as the -- the  
2 program operation itself, was the adaptation  
3 essentially identical or were there differences?

4           THE WITNESS: It was very similar.

5           MR. DUNHAM: Okay. So, if a -- an ARTS IIA  
6 technician was looking at the IIIA documentation for  
7 inhibit areas would he be able to follow that and  
8 achieve it under an ARTS IIA system?

9           THE WITNESS: Probably.

10          MR. DUNHAM: Okay. Take a look at Exhibit  
11 3R.

12          (Pause)

13          MR. DUNHAM: Okay. This is a recommendation  
14 from the Safety Board for November 21st, 1994,  
15 regarding the crash of a Lear jet at Dulles Airport.  
16 Could you refer to that and explain to us the MSAW  
17 adaptation problems that were identified in that  
18 recommendation?

19          THE WITNESS: Yes, I believe this is -- was  
20 the wrong MDA used for the calculation approach on  
21 runway -- runway 1-right where they used the MDA  
22 altitude of the precision approach instead of using the  
23 MDA of the non -- the lowest non-precision approach.  
24 Resulted in a -- an error in that adaptation.

1           MR. DUNHAM: Okay. And was there a specific  
2 standard applicable to that -- to the Dulles system at  
3 the time of that accident?

4           THE WITNESS: Yes, there was.

5           MR. DUNHAM: Okay. And it -- this was not in  
6 compliance with that standard?

7           THE WITNESS: That's correct.

8           MR. DUNHAM: Okay. At that time the Safety  
9 Board asked the FAA to "conduct a complete national  
10 review of all radar environments using MSAW systems.  
11 This review should address all user-defined site  
12 variables for the MSAW programs that control general  
13 terrain warnings as well as runway capture boxes to  
14 ensure compliance with prescribed procedures."

15           As someone familiar with MSAW systems, is the  
16 meaning and intent of this recommendation clear to you?

17           THE WITNESS: It is to me.

18           MR. DUNHAM: Okay. Did the FAA conduct a  
19 review in response to that safety recommendation?

20           THE WITNESS: Yes, they did.

21           MR. DUNHAM: What guidance was available  
22 reference that review to the local facilities to assist  
23 them in ensuring that their MSAW settings were correct?

24           THE WITNESS: One of our organizations in  
25 February of '95 put out a -- a memo to the regional

1 division managers with that exact same verbiage to  
2 check the parameters -- site variable parameters on  
3 MSAW. And it appears that there was a diligent effort  
4 by the Washington office that had that responsibility  
5 to track and report the progress. And there was some  
6 indication that each facility reported back.

7 We have since learned that that's probably  
8 not the best way to do that type of thing. And unless  
9 we have to go out and do what we just did as far as  
10 getting a copy of all the program tapes and have an  
11 independent assessment is the only way that we can  
12 accurately assure ourselves what's in those systems at  
13 that time.

14 MR. DUNHAM: Okay. So it's your opinion that  
15 that review was not in fact effective in identifying  
16 the existing problems?

17 THE WITNESS: Not effective.

18 MR. DUNHAM: Okay. On -- if you could look  
19 at Exhibit 3Q.

20 (Pause)

21 THE WITNESS: Got it.

22 MR. DUNHAM: Okay. This is a report from AOS  
23 on a -- their analysis of an accident that occurred on  
24 January 13th, 1998. It was another Lear jet crash on  
25 approach to runway 2-6 at Houston Intercontinental

1     Airport.  Mr. Howell, are you familiar with this  
2     accident?

3             THE WITNESS:  Yes, I am.

4             MR. DUNHAM:  Okay.  As examined the  
5     adaptation for Houston in use on that date.  Can you  
6     explain what was found?

7             THE WITNESS:  Used the wrong MDA.  Used the  
8     wrong approach MDA.

9             MR. DUNHAM:  Okay.  So how do those problems  
10    relate to the problems found at Dulles in 1994?

11            THE WITNESS:  Same problem.

12            MR. DUNHAM:  Okay.  Do you know how long the  
13    Houston MSAW parameters had been set in that way?

14            THE WITNESS:  No, I don't.

15            MR. DUNHAM:  Is the -- there any evidence at  
16    all when it might have been put in or has it been lost  
17    to -- lost in the records?

18            THE WITNESS:  I don't have any information  
19    about that.

20            MR. DUNHAM:  Okay.  Were there clear  
21    standards for ARTS IIIA MSAW adaptation available prior  
22    to that accident?

23            THE WITNESS:  Yes, there were.

24            MR. DUNHAM:  Were those standards followed?

1 THE WITNESS: No, they weren't.

2 MR. DUNHAM: Okay. Should this problem have  
3 been detected in the 1994 review?

4 THE WITNESS: Yes, it had -- yes, it should.

5 MR. DUNHAM: Okay. How important is the  
6 proper functioning of MSAW to AOS?

7 THE WITNESS: Very important.

8 MR. DUNHAM: And why is that?

9 THE WITNESS: Safety critical item.

10 MR. DUNHAM: Okay. So it provides a safety  
11 critical function to the system?

12 (No response)

13 MR. DUNHAM: Okay. I have no further  
14 questions.

15 (Pause)

16 CHAIRMAN FRANCIS: KCAB?

17 MR. LEE: Mr. Chairman, -- no questions,  
18 thank you.

19 CHAIRMAN FRANCIS: NATCA?

20 MR. MOTE: No.

21 CHAIRMAN FRANCIS: Barton ATC?

22 MR. E. MONTGOMERY: No questions, Mr.  
23 Chairman.

24 CHAIRMAN FRANCIS: Government of Guam?

1 MR. DERVISH: Just a very minor question, Mr.  
2 Howell. You'll have to excuse me. I need more  
3 clarification than most.

4 When you said prior to October of '97 the  
5 local facility had the option of installing or  
6 modifying the software, what do you mean by local  
7 facility? Is that the CERAP or is that --

8 THE WITNESS: Yes.

9 MR. DERVISH: So it was the FAA CERAP that  
10 modified the Guam --

11 THE WITNESS: They had the --

12 MR. DERVISH: -- software?

13 THE WITNESS: -- the -- they could modify the  
14 -- the ARTS IIA program.

15 MR. DERVISH: Yeah. 'Cause you said in '95  
16 it was modified, new software.

17 THE WITNESS: Could you repeat this question?  
18 I'm not sure that I understand what you're --

19 MR. DERVISH: Yeah. You -- you keep  
20 referring to the local facility, and you said prior to  
21 October of '97 the local facility had the option of  
22 modifying the software for the MSAW and that -- you  
23 also said that in 1995 it was modified at Guam. Who is  
24 the local facility that modified that software that  
25 created that double inner ring?

1 THE WITNESS: Okay. The -- the adaptation.

2 MR. DERVISH: The adaptation, okay.

3 THE WITNESS: The requirements come from the  
4 facility.

5 MR. DERVISH: Okay. And who's --

6 THE WITNESS: To the -- to the tech center.

7 MR. DERVISH: Are we talking about the Guam  
8 Airport Authority? Are we talking about the --

9 THE WITNESS: FAA facility.

10 MR. DERVISH: Okay. So it is an FAA  
11 decision?

12 THE WITNESS: FAA facility, yes.

13 MR. DERVISH: Okay. Thank you.

14 THE WITNESS: You're welcome.

15 CHAIRMAN FRANCIS: Just -- just to pursue  
16 that for a second. How would that work within the  
17 facility? I mean would that come to -- to the tech  
18 center via AF because of an AT requirement in terms of  
19 false alarms or how would that have worked internal to  
20 -- to the CERAP?

21 THE WITNESS: That would come from AT to the  
22 tech center.

23 CHAIRMAN FRANCIS: From AT?

24 THE WITNESS: From AT.

1 CHAIRMAN FRANCIS: With AF not involved in it  
2 then?

3 THE WITNESS: No.

4 CHAIRMAN FRANCIS: Okay. Thank you.  
5 Boeing Company?

6 MR. DARCY: Mr. Francis, we have two  
7 questions.

8 The first one is can you explain, Mr. Howell,  
9 why there was a visual but not an oral alert on the  
10 Micro-EARTS implementation?

11 THE WITNESS: Yes. The oral alert on the  
12 Micro-EARTS has a -- parameter value of zero to 200-  
13 some seconds to display or sound the alarm for that  
14 many seconds. The alarm was -- value was set to zero.

15 MR. DARCY: Do you -- oh, okay. I think I  
16 understand.

17 And the second question I guess is, is it  
18 correct to assume there was a -- different adaptation  
19 for the Micro-EARTS and the ARTS IIA? And if so, why  
20 were they done differently?

21 THE WITNESS: The concept is the same.  
22 They're just adapted differently. The ARTS -- the  
23 Micro-EARTS does not have a digital terrain map  
24 capability to use the -- the digital terrain maps, the  
25 bins, the two-mile bins. But they do have the ability

1 to adapt approach capture boxes.

2 MR. DARCY: Okay. Would that -- would that  
3 result in -- or the -- the Micro-EARTS not being  
4 adapted the same way, would that result in nuisance  
5 alerts on that system that -- that didn't occur on the  
6 ARTS IIA?

7 THE WITNESS: Not necessarily.

8 MR. DARCY: Can you explain why that would be  
9 for -- for me? Sorry, I don't quite get it.

10 THE WITNESS: Well, one system uses digital  
11 terrain maps for -- for general terrain warning, and  
12 the other system would develop its -- its base altitude  
13 off of minima of our altitude charts in the form of  
14 polygons.

15 MR. DARCY: Okay. I see. Thank you. That's  
16 all the questions.

17 CHAIRMAN FRANCIS: Korean Air?

18 CAPTAIN KIM: I have one question by my  
19 assistant.

20 FIRST OFFICER CHUNG: Thank you for allowing  
21 us to ask you some questions.

22 The first one is a -- a point of  
23 clarification. When you just answered to our Boeing  
24 party about the setting being zero, is that in -- in  
25 essence saying that the setting was turned off?

1           THE WITNESS: It was functioning for zero  
2 seconds so there was no alert -- there was no oral  
3 alarm generated.

4           FIRST OFFICER CHUNG: But you would not say  
5 that this is exactly the same as saying that it was  
6 turned off?

7           THE WITNESS: That's correct.

8           FIRST OFFICER CHUNG: Thank you.

9           And follow-on to that question would be if  
10 that is the case, can you give us a reason for that?  
11 Why it was set at zero?

12           THE WITNESS: Yes, because that system in  
13 Guam, the Micro-EARTS is predominantly used for en  
14 route operations. And there is no requirement or no  
15 policy for an oral alarm in the en route environment.  
16 They use the IIA system for the route -- approach  
17 processing.

18           FIRST OFFICER CHUNG: Thank you. You'll  
19 pardon us asking one more uneducated question. Most of  
20 us are not familiar with the system, and regarding  
21 something you mentioned. I believe it was during  
22 optimization you said the technology to achieve this --  
23 and it was -- seems to be done -- had been done rather  
24 quickly -- that the technology only recently became  
25 available. Were you referring to that -- with

1 adaptation or -- I'm sorry, or with optimization?

2 THE WITNESS: Well, the tools that we have  
3 used to optimize the systems when -- when Micro -- when  
4 MSAW was developed back in the '70s and early '80s we  
5 didn't have flight PCs, and now we're using PCs to  
6 quickly analyze this data and paint -- or develop  
7 pictures that somebody can visually look at. Before  
8 they were just looking at software coding. Very hard  
9 to analyze.

10 FIRST OFFICER CHUNG: So you were referring  
11 to adaptation and not optimization when you said  
12 recently?

13 THE WITNESS: Optimization of the adaptation.

14 FIRST OFFICER CHUNG: And a date of ~~around~~  
15 1990 was mentioned. What was that in reference to?  
16 Optimization of adaptation was -- technology became as  
17 early as 1990, is that our understanding or --

18 THE WITNESS: No, in 1990 MSAW was put into  
19 the ARTS IIA program.

20 FIRST OFFICER CHUNG: Okay. When you said  
21 recently, then could you put a date or a year on the  
22 recent technology that makes the optimization process  
23 available today?

24 THE WITNESS: We used PC technology in the  
25 fall of this year to develop the -- the tools necessary

1 to optimize the programs. Of -- we could have done it  
2 other ways, but now we've got tools that we can do it  
3 quickly.

4 FIRST OFFICER CHUNG: Did you say fall of  
5 last year was really the first time this optimization  
6 process could have taken place?

7 THE WITNESS: That's hard to answer. I guess  
8 it could have taken place a little bit sooner.

9 FIRST OFFICER CHUNG: Okay. Thank you very  
10 much.

11 CHAIRMAN FRANCIS: FAA?

12 MR. DONNER: Yes, Mr. Chairman, I have just  
13 one question for Mr. Howell.

14 Sir, earlier you mentioned that the alert at  
15 15:42 and 20 seconds was displayed on the radar but I  
16 don't believe you said whether or not that was the only  
17 time that there was an alert displayed on the radar.  
18 Was it?

19 THE WITNESS: That was the only time the  
20 alert was displayed on the radar.

21 MR. DONNER: Thank you.

22 CHAIRMAN FRANCIS: Mr. Feith?

23 MR. FEITH: Just a couple of follow-up  
24 questions, one regarding the EARTS MSAW.

1           Had the EARTS MSAW had an approach slope  
2     warning capability like the -- the ARTS II did, is it  
3     likely that we would have gotten a warning much earlier  
4     than the six-second time period that we did have?

5           THE WITNESS: No.

6           MR. FEITH: Can you tell me why?

7           THE WITNESS: The distance from the airport  
8     would not have changed. So, it was -- the penetration  
9     point at the distance from the airport that triggered  
10    that alarm more so than the altitude of the slope.

11          MR. FEITH: You had answered a question. I  
12    think it was for Mr. Dunham regarding the rehab --  
13    readaptation and -- and if the readaptation site at  
14    Guam when it was -- or I should the readaptation that  
15    occurred at Guam hadn't been flight checked. First  
16    off, why not? And second off, how do you validate the  
17    -- the -- the new software change if it isn't flight  
18    checked?

19          THE WITNESS: Well, let me correct this. Not  
20    -- I -- I have no knowledge of whether it was flight  
21    checked or not.

22          MR. FEITH: Okay.

23          THE WITNESS: So, I -- I can't say no, it  
24    wasn't flight checked. I have no knowledge of whether  
25    it was or not. Maybe somebody else can answer that

1 question.

2 MR. FEITH: Do you know if any of the other  
3 readapted sites had been flight checked?

4 THE WITNESS: Yes, I do.

5 MR. FEITH: Is that a typical practice to  
6 validate the new software changes?

7 THE WITNESS: Yes, it is.

8 MR. FEITH: You had mentioned something about  
9 a waiver that had -- had been issued or is issued when  
10 a site wants to change the parameters for the -- the  
11 MSAW. Do you -- Guam was issued a waiver?

12 THE WITNESS: I don't know.

13 MR. FEITH: Okay. Very good. Thank you.  
14 That's all I have.

15 CHAIRMAN FRANCIS: Pat?

16 MR. CARISEO: No questions, Mr. Chairman.

17 CHAIRMAN FRANCIS: Ben?

18 MR. BERMAN: Mr. Howell, you mentioned that  
19 the -- the false alarm problem at Guam is -- is -- is  
20 fixable, is that correct?

21 THE WITNESS: I think we can improve it.

22 MR. BERMAN: When will -- when will that be  
23 completed?

24 THE WITNESS: Should be a patch on the way  
25 out there this week.

1           MR. BERMAN: Okay. One more thing. I wanted  
2 to just get some clarification on an answer you gave to  
3 Mr. Feith a minute ago about the -- the difference  
4 between the EARTS MSAW approach slope warning and not  
5 having that feature. If -- if the approach slope  
6 warning wouldn't have provided additional assistance  
7 here in the case of EARTS, why would the ARTS II have  
8 provided 60 seconds of warning if it had been working  
9 correctly?

10           THE WITNESS: I believe the aircraft  
11 penetrated the side of the box. It didn't descend into  
12 the box. It penetrated the side of the box.

13           MR. BERMAN: Okay. I think I understand.

14           (Pause)

15           MR. M. MONTGOMERY: Thank you, Mr. Chairman.

16           Mr. Howell, let me ask you what I hope is a  
17 rhetorical question. In the development of the  
18 replacement systems for the ARTS programs, the common  
19 ARTS, which is now under way, and soon to be the STARS  
20 system, we hope, is your office working with these  
21 programs to make sure that all these improvements that  
22 you've made in the ARTS II and ARTS III systems will be  
23 maintained and promulgated?

24           THE WITNESS: Yes, definitely. We are very  
25 closely related and working with them on these -- this

1 issue.

2 MR. M. MONTGOMERY: Okay. Thank you. No  
3 more questions.

4 CHAIRMAN FRANCIS: Let me -- I don't have any  
5 questions. Let me make a little editorial personal  
6 comment here.

7 I think that this exchange that we just had  
8 is -- is exactly what I was talking about this morning  
9 in terms of people cooperating together to try to make  
10 the system safer. Mr. Howell has been professional,  
11 candid, forthcoming, and constructive, and I think that  
12 our questioners Charlie and Scott with the assistance  
13 of Richard Wentworth have -- have also handled this  
14 very well. And I -- I appreciate it. I think that's  
15 in everyone's interest that -- that something that is  
16 as sensitive as this and could have been as difficult  
17 has been as productive for -- for all of us. Thank you  
18 very much.

19 THE WITNESS: You're welcome.

20 (Whereupon, the witness was excused.)

21 CHAIRMAN FRANCIS: Our next witness -- you're  
22 free to -- our next witness, David Canoles, manager,  
23 Evaluations Investigations Staff, AAT-20.

24 (Pause)

1 CHAIRMAN FRANCIS: Oh, I'm sorry. I'm on the  
2 wrong -- missed one here. Sabra Kaulia, deputy  
3 director, Air Traffic Operations Programs, FAA in  
4 Washington.

5

6

7

8 Whereupon,

9

SABRA KAULIA

10 was called as a witness, and first having been duly  
11 sworn, was examined and testified as follows:

12

TESTIMONY OF

13

SABRA KAULIA

14

AIR TRAFFIC OPERATIONS PROGRAM, ATO-2

15

FEDERAL AVIATION ADMINISTRATION

16

WASHINGTON, D.C.

17

MR. SCHLEEDE: Please state your full name  
18 and business address for our record?

19

THE WITNESS: My name is Sabra Kaulia.  
20 Business address is 800 Independence Avenue, Southwest;  
21 Washington, D.C.

22

MR. SCHLEEDE: And you work for the FAA?

23

THE WITNESS: Yes, I do.

24

MR. SCHLEEDE: In what position?

1 THE WITNESS: I'm the deputy program director  
2 for Air Traffic Operations.

3 MR. SCHLEEDE: Okay. Could you give us a  
4 brief summary of your training, education, experience  
5 that brings you to your present position? And again,  
6 please try to speak slowly and pause between the  
7 sentences.

8 THE WITNESS: I have 27 years of experience  
9 air traffic control, including six operational air  
10 traffic control facilities both in the en route and the  
11 terminal environment, positions as a supervisor, staff  
12 support specialist, Washington headquarters and  
13 regional. Facility management, both assistant  
14 management and manager time. Regional air traffic  
15 assistant division manager and now deputy program  
16 director.

17 MR. SCHLEEDE: Thank you very much.

18 Mr. Dunham?

19 MR. DUNHAM: Good afternoon. Could you  
20 please -- sorry. Could you please explain from a  
21 operational perspective the reasons for having MSAW  
22 functions in air traffic control software?

23 THE WITNESS: The MSAW system is a function  
24 of our Automated Radar Processing System. That is a  
25 tool to assist the controller by providing information

1 so they can help the pilot avoid terrain and/or  
2 obstructions.

3 MR. DUNHAM: Okay. And what's the role of  
4 MSAW in the prevention of CFIT accidents?

5 THE WITNESS: To provide the controller with  
6 an additional alert, an automated alert through that  
7 processing regarding aircraft proximity, potential  
8 proximity to terrain or obstructions.

9 MR. DUNHAM: Okay. And this software is in  
10 use in both en route and terminal facilities?

11 THE WITNESS: Yes, it is.

12 MR. DUNHAM: Okay. If a radar controller  
13 inadvertently cleared an aircraft to operate below the  
14 minimum IFR altitude for the area it was in in close  
15 proximity to either terrain or obstructions, please  
16 describe the various ways that error might be brought  
17 to their attention.

18 THE WITNESS: The read-back from the pilot  
19 could bring that altitude to their attention. The  
20 observance of the aircraft proceeding into an area  
21 below their depicted altitudes on their radar scope  
22 could do that. And also, the MSAW system could do  
23 that.

24 MR. DUNHAM: Okay. Number two and three are  
25 actually the same thing, are they not?

1           THE WITNESS: Not necessarily. I believe  
2     number two, what I was referring to is the observance  
3     of the target of the aircraft and its altitude  
4     reference the altitude that you either thought you had  
5     issued or would have issued, not the alert itself, the  
6     low altitude flashing in the tag.

7           MR. DUNHAM: Okay.

8           THE WITNESS: The third was that one.

9           MR. DUNHAM: Okay. Could you look at Exhibit  
10    3I3? I'm sorry. Page three.

11          THE WITNESS: Yes.

12          MR. DUNHAM: And just read us the part there  
13    about safety alerts. We've had a couple of paraphrases  
14    of it today, but I thought we should get the exact  
15    words.

16          THE WITNESS: You want me to read the  
17    paragraph for safety alert?

18          MR. DUNHAM: Yeah, and just explain what --  
19    what safety alerts are.

20          THE WITNESS: Paragraph 2- -- 1-6, safety  
21    alert. "Issue a safety alert to an aircraft if you are  
22    aware the aircraft is in a position slant altitude  
23    which in your judgment places it in unsafe proximity to  
24    terrain, obstructions, or other aircraft. Once the  
25    pilot informs you action is being taken to resolve the

1 situation, you may discontinue the issuance of further  
2 alerts. Do not assume that because someone else has  
3 responsibility for the aircraft that the unsafe  
4 situation has been observed and the safety alert  
5 issued. Inform the appropriate controller."

6 MR. DUNHAM: Okay. And -- and what priority  
7 does that fall under in the controller's overall  
8 workload?

9 THE WITNESS: This is a first priority.

10 MR. DUNHAM: And it's equivalent to what?

11 THE WITNESS: Control instructions.

12 MR. DUNHAM: Separation of aircraft?

13 THE WITNESS: Yes.

14 MR. DUNHAM: Yes. So -- so, separation and  
15 safety alerts are equal priority?

16 THE WITNESS: First priority.

17 MR. DUNHAM: Okay.

18 THE WITNESS: Yes.

19 MR. DUNHAM: Is an MSAW activation an event  
20 that could cause a controller to issue a safety alert?

21 THE WITNESS: Yes.

22 MR. DUNHAM: Okay. So then, responding to an  
23 MSAW alert under some circumstances could be a first  
24 priority duty?

1 THE WITNESS: If in the controller's judgment  
2 there was an unsafe situation, yes.

3 MR. DUNHAM: Okay. And what of the possible  
4 consequences of MSAW misconfiguration or malfunction?

5 THE WITNESS: In the absence of processing we  
6 would not have this additional alert system and/or  
7 automated process available.

8 MR. DUNHAM: Okay. So do you believe that  
9 MSAW makes an important contribution to the overall  
10 level of safety in NAS operations?

11 THE WITNESS: Yes, I do.

12 MR. DUNHAM: Okay. Could you look at Exhibit  
13 Z 32? Z like zebra.

14 (Pause)

15 THE WITNESS: 3Z?

16 MR. DUNHAM: That's correct. 3Z 32.

17 (Pause)

18 MR. DUNHAM: Sorry. I'm a little slow  
19 dredging it up myself.

20 (Pause)

21 MR. DUNHAM: Okay. Paragraph 5-2-2, item  
22 classification?

23 THE WITNESS: Yes.

24 MR. DUNHAM: Number D says problem. Now,  
25 this is an explanation of how items are classified on a

1 facility evaluation report. Could you explain to us  
2 what the definition of a problem is as shown here in  
3 this order?

4 THE WITNESS: I could read that to you, but I  
5 believe that really is outside my expertise. This is -  
6 -

7 MR. DUNHAM: Well, we could --

8 THE WITNESS: -- the evaluations.

9 MR. DUNHAM: Go ahead and read this and then  
10 we'll -- we'll talk about that.

11 THE WITNESS: Okay And specific under D you  
12 wanted to hear which part?

13 MR. DUNHAM: The definitions of problem  
14 items.

15 THE WITNESS: "Problem items are those (A)  
16 items identified that are in contradiction to national,  
17 regional, hub, or facility directives. The specific  
18 refer -- reference shall be noted at the end of each  
19 problem description. (B) Items not governed by  
20 specific references but which clearly and negatively  
21 affect performance programs, quality of service, or  
22 efficiency. (C) Items identified as hub, regional, or  
23 national in scope, the resolution of which requires  
24 action above the facility level."

1 MR. DUNHAM: Okay. That's fine.

2 Do you feel that loss of MSAW functionality  
3 meets the Section B, there the -- that it clearly and  
4 negatively affects quality of service?

5 THE WITNESS: Again, I'm not sure -- that is  
6 outside of my area of expertise. I'm not sure I could  
7 respond to that.

8 MR. DUNHAM: You've been an operational  
9 facility manager, correct?

10 THE WITNESS: Yes, sir.

11 MR. DUNHAM: And you're responsible for the  
12 quality of service of the facility you're running?

13 THE WITNESS: Yes, sir.

14 MR. DUNHAM: Okay. So, in that case, if you  
15 -- your facility lost MSAW functionality, would you  
16 consider that clearly a negatively affecting the  
17 quality of the service?

18 THE WITNESS: Depending on the facility I was  
19 in and the guidelines and national requirements I was  
20 given it would determine whether it would fit under  
21 that evaluation category.

22 MR. DUNHAM: I'm -- I'm not --

23 THE WITNESS: It's a broad scope. I'm sorry.

24 MR. DUNHAM: I'm not asking you to evaluate  
25 it. I'm just saying as a -- as an operational manager,

1 would you feel that was a problem for your facility?

2 THE WITNESS: I would not use that word. I  
3 would consider it serious.

4 MR. DUNHAM: Okay. Is the overall level of  
5 safety in AT system related to the quality of service  
6 it provides?

7 THE WITNESS: I'm sorry. Could you repeat  
8 that?

9 MR. DUNHAM: Is the overall level of safety  
10 in the ATC system related to the quality of service  
11 that it provides?

12 THE WITNESS: Yes.

13 MR. DUNHAM: Okay. Could you explain how  
14 loss of ATC terrain warnings for both pilots and  
15 controllers affects quality of service?

16 THE WITNESS: Specifically meaning the MSAW  
17 service?

18 MR. DUNHAM: Yes.

19 THE WITNESS: It is a secondary activity, a  
20 secondary piece of information that would be missing.  
21 So, the additional service of MSAW would be missing.  
22 That would be the impact.

23 MR. DUNHAM: Does that have any effect on  
24 safety?

1           THE WITNESS: I think the -- it would be an  
2       absence of an additional system. I'm not sure I  
3       understand your question. I'm sorry.

4           MR. DUNHAM: Does MSAW have any effect on the  
5       safety of the system?

6           THE WITNESS: It assists the controller. It  
7       enhances the safety.

8           MR. DUNHAM: Okay. So, if it's absent what  
9       does it do to the level of safety?

10          THE WITNESS: It's an additional piece of  
11       information that's not there.

12          MR. DUNHAM: Okay. Could you please explain  
13       the obligations at the time of the accident of FAA  
14       facility managers regarding the maintenance and  
15       configuration of MSAW systems?

16          THE WITNESS: The -- the facility management  
17       -- you specifically require -- requesting regarding  
18       Guam or the system in general?

19          MR. DUNHAM: In general.

20          THE WITNESS: The facility management  
21       handbook provides some guidance for that. The 7210.3.  
22       And it's very broad. It read -- it allows facility  
23       management to inhibit systems. It requires oversight  
24       of the digital terrain maps of other mapping parts of  
25       that system. I'd have to refer to that particular

1 handbook to give you more specific.

2 MR. DUNHAM: Okay. That -- that's probably  
3 clear enough.

4 Was the ARTS IIA MSAW system at Guam CERAP  
5 operating in accordance with established standards and  
6 policies at the time of the accident?

7 THE WITNESS: Yes, it was.

8 MR. DUNHAM: Was MSAW providing any  
9 operationally meaningful services as configured at the  
10 time?

11 THE WITNESS: Not outside that one-mile ring,  
12 no.

13 MR. DUNHAM: Okay. Do you know what the  
14 terrain is under that one-mile ring?

15 THE WITNESS: I'm -- I'm not personally  
16 familiar with the 54-miles all the way around, but I  
17 don't think there was much terrain there.

18 MR. DUNHAM: Okay. Was there in fact any  
19 operationally significant distinction between the Guam  
20 MSAW performing as configured at the time of the  
21 accident and MSAW being completely shut off?

22 THE WITNESS: I'm -- any significant  
23 difference? Could you repeat that? Thank you.

24 MR. DUNHAM: That was -- that was essentially  
25 the point. Do you --

1 THE WITNESS: Okay.

2 MR. DUNHAM: --was there in fact any  
3 operationally significant distinction between the Guam  
4 MSAW performing as configured at the time of the  
5 accident and MSAW being completely shut off?

6 THE WITNESS: No, I would believe there  
7 isn't.

8 MR. DUNHAM: Okay. Do you use as part of  
9 your job full facility evaluation reports for  
10 exercising your ATC management responsibilities?

11 THE WITNESS: In my current position we do  
12 review reports that are sent to us.

13 MR. DUNHAM: Okay. And from time to time you  
14 might use those reports to identify problems in the  
15 system?

16 THE WITNESS: No. We -- we would not  
17 identify problems. The report would identify things  
18 that they have found, that the evaluations people have  
19 found. We would review that to see if there was impact  
20 on the procedures and day-to-day operation as we manage  
21 it.

22 MR. DUNHAM: Okay.

23 (Pause)

24 MR. DUNHAM: Okay. Could you look at Exhibit  
25 3P, like puppet?

1 (Pause)

2 THE WITNESS: Yes.

3 MR. DUNHAM: Okay. This is the 1997 Guam  
4 CERAP full facility evaluation report. Based on the  
5 information contained in this report, what was the  
6 apparent status of the MSAW system at that time?

7 THE WITNESS: In the 1997 report?

8 MR. DUNHAM: Yes.

9 THE WITNESS: The 1997 report I believe did  
10 not mention the MSAW system.

11 MR. DUNHAM: And what does that tell you  
12 about it under normal circumstances?

13 THE WITNESS: There would be no problems  
14 identified.

15 MR. DUNHAM: Okay.

16 (Pause)

17 MR. DUNHAM: Mr. Howell has described the  
18 visual and oral alarms which are provided by ARTS and  
19 EARTS in response to conflict alert and MSAW  
20 activations and has noted that the EARTS oral alarm was  
21 disabled at the time of the accident. What effect  
22 would this have on the ability of CERAP controllers to  
23 detect an MSAW alarm activation?

24 THE WITNESS: On the EARTS system they would  
25 not receive the oral alarm but they would still be able

1 to see and -- and visually notice the visual attached  
2 alarm.

3 MR. DUNHAM: Okay. The Guam CERAP  
4 controllers on the midnight shift are using multiple  
5 radar scopes so their attention is sometimes distracted  
6 from one to the other. Would having an oral alarm  
7 contribute to bringing the alarm to their attention?

8 THE WITNESS: Conceivably.

9 MR. DUNHAM: Is disabling the oral alarm a  
10 common practice within the ATC facilities?

11 THE WITNESS: Within all ATC facilities?

12 MR. DUNHAM: Terminal and CERAPs.

13 THE WITNESS: That's outside my knowledge  
14 area. To my knowledge within the terminal ATC  
15 facilities it is not normal.

16 MR. DUNHAM: Okay. How about within the  
17 CERAPs?

18 THE WITNESS: CERAPs and en route, to my  
19 knowledge, it is normal.

20 MR. DUNHAM: Okay.

21 (Pause)

22 MR. DUNHAM: Would you look at Exhibit 3S,  
23 like Sam, 1, please?

24 THE WITNESS: Yes.

1           MR. DUNHAM: This is a Safety Board  
2       recommendation number 95-120 asking FAA to install oral  
3       MSAW warning equipment in VFR towers that receive radar  
4       information from a host radar control facility and  
5       would otherwise receive only a visual MSAW alert. The  
6       last response received from FAA seems to indicate that  
7       the recommendation has been accepted but only discusses  
8       ARTS III facilities. Is the oral alarm feature being  
9       extended to VFR towers currently covered by ARTS IIA  
10      systems?

11           THE WITNESS: Yes. The new automated system  
12      being delivered called Common ARTS contains that  
13      capability. It will have it for all of them. And that  
14      will be installed at all ARTS II -- current ARTS II  
15      facilities. I believe the projected date is April of  
16      2000 to complete that waterfall.

17           MR. DUNHAM: Okay. When will -- in  
18      particular, when will Agana Tower receive an oral alarm  
19      capability?

20           THE WITNESS: I don't personally know the  
21      date of the waterfall for them. It will be sometime  
22      between now and April of 2000.

23           MR. DUNHAM: Okay. Could -- could you  
24      provide that for the record after your testimony?

1 THE WITNESS: Yes.

2 MR. DUNHAM: Okay. Is there any intention of  
3 providing the oral alarm capability through their  
4 current ARTS IIA system prior to the installation of  
5 the IIE?

6 THE WITNESS: Technically, again, this is  
7 outside of my area of expertise. As I understand the  
8 way the system is built, the technical capabilities of  
9 the system, it cannot provide that oral alarm directly  
10 to two different airports as a primary, only to one  
11 primary. And Agana is the secondary airport in that  
12 system, so it cannot be adapted to do that. That's why  
13 Common ARTS is necessary to provide that to all of them  
14 in the ARTS II environment.

15 MR. DUNHAM: So, under the current  
16 capabilities of ARTS IIA as you understand it, the  
17 alarm will continue to be sent only to the CERAP?

18 THE WITNESS: As I understand it, yes.

19 MR. DUNHAM: At the time of the accident what  
20 was the staffing level of Guam CERAP?

21 THE WITNESS: The reports indicated two  
22 controllers on duty.

23 MR. DUNHAM: And is that normal and  
24 acceptable for midnight shift operations?

1 THE WITNESS: Yes.

2 (Pause)

3 MR. DUNHAM: Which facility was responsible  
4 for providing IFR services to the Korean aircraft at  
5 the time of the crash, the actual impact?

6 THE WITNESS: IFR services would be provided  
7 by the approach control or the CERAP facility.

8 MR. DUNHAM: Okay. So, as far as actual ATC  
9 responsibility for the aircraft, that remained with the  
10 CERAP?

11 THE WITNESS: For the IFR in-flight services,  
12 yes.

13 MR. DUNHAM: Okay. If CERAP is responsible  
14 for providing all the IFR services to Korean Air 801,  
15 why did it not initiate the search-and-rescue response  
16 when informed by Agana Tower that the aircraft couldn't  
17 be located?

18 THE WITNESS: I do not know that answer.

19 MR. DUNHAM: Okay.

20 (Pause)

21 MR. DUNHAM: Okay. No further questions.

22 (Pause)

23 CHAIRMAN FRANCIS: KCAB?

24 MR. LEE: Thank you, Chairman. Just one  
25 question. Did FAA head office evaluate Guam CERAP

1 personnel levels and working shift and MSAW training,  
2 training status, etc., after the Korean Airlines 801  
3 accident? If there are some improvements to be made,  
4 could you please explain them briefly?

5 THE WITNESS: I'm sorry. I'm getting a lot  
6 of feedback. Could you repeat that?

7 MR. LEE: Okay. If there are some  
8 improvements to be made could you please explain them?

9 CHAIRMAN FRANCIS: He's -- he's asking the  
10 question in English.

11 MR. LEE: Did the FAA --

12 (Pause)

13 THE WITNESS: I'm getting feedback.

14 I -- I understand the --

15 CHAIRMAN FRANCIS: Why don't you just take --

16 THE WITNESS: -- there are improvements --

17 CHAIRMAN FRANCIS: -- take the headset off.

18 THE WITNESS: All right. That may help.

19 MR. LEE: One more? Okay. Did the FAA head  
20 office evaluate Guam CERAP's personnel levels, working  
21 shift, MSAW training status, etc. after the Korean  
22 Airlines 5801 accident? If there are some improvements  
23 to be made, could you please explain them?

24 THE WITNESS: I'm sorry. I still don't  
25 believe I understand the nature of your question. Is

1     it reference search-and-rescue efforts after the  
2     accident?

3             MR. LEE:  Not -- no, not search-and-rescue.  
4     Just in CERAP's personnel levels and qualification and  
5     working shifts and training -- etc.

6             THE WITNESS:  Okay.  Staffing and training --

7             MR. LEE:  Just the evaluate -- the evaluate  
8     to them -- just controller.  Just evaluated on the  
9     investigation staff for the CERAP -- CERAP's office.

10            THE WITNESS:  Okay.  I'm -- my office does  
11    not oversee the training and personnel activities.  I  
12    am not aware of any issues in that area.

13            MR. LEE:  Okay.

14            Okay.  That's it.  Thank you.

15            CHAIRMAN FRANCIS:  Government of Guam?

16            MR. DERVISH:  No questions.

17            CHAIRMAN FRANCIS:  Boeing Company?

18            MR. DARCY:  No questions.

19            CHAIRMAN FRANCIS:  Korean Air?

20            CAPT. KIM:  No questions, sir.

21            CHAIRMAN FRANCIS:  Barton ATC?

22            MR. E. MONTGOMERY:  No questions.

23            CHAIRMAN FRANCIS:  NATCA?

24            MR. MOTE:  No questions, Mr. Chairman.  Thank  
25    you.

1 CHAIRMAN FRANCIS: We'll have to rely on Mr.  
2 Donner to ask a question.

3 MR. DONNER: Gee, I'm sorry, Mr. Chairman. I  
4 don't have any.

5 CHAIRMAN FRANCIS: Thank you.  
6 Monty?

7 MR. M. MONTGOMERY: Thank you. No questions,  
8 Mr. Chairman.

9 CHAIRMAN FRANCIS: Thank you very much.  
10 (Whereupon, the witness was excused.)

11 CHAIRMAN FRANCIS: The next witness will be  
12 Mr. David Canoles, Manager, Evaluations and  
13 Investigations Staff, FAA.

14

15 Whereupon,

16 DAVID CANOLES  
17 was called as a witness, and first having been duly  
18 sworn, was examined and testified as follows:

19 TESTIMONY OF

20 DAVID CANOLES

21 MANAGER

22 EVALUATIONS AND INVESTIGATIONS STAFF, AAT-20

23 FEDERAL AVIATION ADMINISTRATION

24 WASHINGTON, D.C.

1           MR. SCHLEEDE: Mr. Canoles, please give us  
2 your full name and business address for the record?

3           THE WITNESS: My name is John David Canoles.  
4 My business address is Federal Aviation  
5 Administration, AAT-20; 800 Independence Avenue,  
6 Southwest; Washington, D.C., 20591.

7           MR. SCHLEEDE: And what is your current  
8 position at the FAA?

9           THE WITNESS: Current position is manager of  
10 the Air Traffic Evaluations and Investigations Staff,  
11 AAT-20.

12          MR. SCHLEEDE: Would you give us a brief  
13 summary of your training and education experience that  
14 qualifies you for your present position?

15          THE WITNESS: Yes, sir. I will.

16          I've been employed by the Federal Aviation  
17 Administration --

18          MR. SCHLEEDE: Slowly, please.

19          THE WITNESS: I've been employed by the  
20 Federal Aviation Administration in air traffic control  
21 for 27 years. I held journeyman air traffic control  
22 positions in three FAA terminals, held later post of  
23 training specialist, first-line supervisor, was manager  
24 of two air traffic facilities, including the tower in  
25 Newark, New Jersey.

1           In 1980 I became manager -- I'm sorry. In  
2           1987 I became manager of the air traffic division for  
3           the eastern region therefore providing oversight over  
4           all facilities in that region. Subsequently was  
5           manager of the air traffic procedures division until  
6           two years ago when I accepted the position I have now.

7           MR. SCHLEEDE: Thank you very much. Mr.  
8           Dunham will begin the questioning slowly.

9           MR. DUNHAM: I'm really trying.

10          Mr. Canoles, good afternoon. What is the  
11          purpose of the FAA National Facility Evaluation  
12          Program?

13          THE WITNESS: Basically, the Evaluation  
14          Program measures the effectiveness and compliance of  
15          all field facilities with national standards,  
16          directives, and orders.

17          MR. DUNHAM: And how are evaluations  
18          conducted?

19          THE WITNESS: Evaluations are conducted on a  
20          regularly scheduled basis by teams of air traffic  
21          experts who are employed within my organization. These  
22          teams will range in size and duration of visit based on  
23          the size of the facility they are evaluating. They  
24          will travel on-site, collect data. They operate in  
25          accordance with a published checklist which can range

1 to several hundred items for -- for our more complex  
2 facilities, consist of evaluations and other  
3 measurements during their period of time in the  
4 facility, and the culmination of these visits is a  
5 written report which is given to facility management as  
6 well as management of the air traffic division having  
7 operational control over that facility.

8 MR. DUNHAM: How long does a typical  
9 evaluation take to complete of, say, a CERAP?

10 THE WITNESS: I'm guessing -- it's --  
11 typically our evaluations range from three days to two  
12 weeks. I would say that an evaluation of a CERAP would  
13 probably involve four to five of my specialists for a  
14 duration of approximately one week.

15 MR. DUNHAM: And what is the composition of a  
16 typical facility evaluation team?

17 THE WITNESS: Again, the -- the range of  
18 numbers varies depending upon the size of the facility  
19 and the commensurate levels of work to be accomplished.  
20 Evaluators themselves are selected into this  
21 organization from among active air traffic control  
22 specialists. Typically, only those who have attained  
23 at least the rank of first-line supervisor. So in fact  
24 we're -- we're selecting individuals who have already  
25 distinguished themselves as -- as excellent controllers

1 in the first place. We try to maintain a mix of those  
2 who specialize in the en route terminal and flight  
3 service options.

4 MR. DUNHAM: Are the evaluators required to  
5 be experts in the area they are assigned to evaluate?

6 THE WITNESS: Not in all cases. For example,  
7 one of the areas that an evaluation would look at would  
8 be training. An air -- an air traffic controller  
9 proficient in training in a terminal facility could  
10 transfer those skills and knowledges and successfully  
11 evaluate an en route or a flight service facility.  
12 Therefore, we transfer that. Operational oversight is  
13 restricted to -- to people with experience in that  
14 particular option.

15 MR. DUNHAM: So, when the Guam CERAP  
16 automation functions were evaluated, would that have  
17 been done by an automation-trained specialist?

18 THE WITNESS: No. We did not evaluate the  
19 Guam CERAP automation functions nor do we evaluate the  
20 automation functions of any air traffic facility. Our  
21 evaluation focuses simply on operational effectiveness  
22 and compliance.

23 MR. DUNHAM: So, the automation section of  
24 the checklist that they use to do an evaluation  
25 actually accomplishes what?

1           THE WITNESS: No, the items contained in the  
2       evaluations portion of the checklist -- and  
3       incidentally, that has been modified just as a clerical  
4       point since -- since this accident -- are rudimentary  
5       at best. For example, in the area of MSAW at the time  
6       of this accident basically all we were doing was  
7       checking to make sure that the audible portion of the  
8       alarm was workable and had not been modified in the  
9       facilities. But as far as any in-depth evaluation of  
10      software, that is not accomplished by my teams.

11          MR. DUNHAM: You said that evaluations are  
12      conducted on a regularly scheduled basis. Do you  
13      believe that providing advance notice of an upcoming  
14      evaluation leads to a true picture of the facility's  
15      day-to-day quality of operation and compliance with  
16      directives?

17          THE WITNESS: I believe that it does by and  
18      large. And frankly, there's a trade-off involved.  
19      Surprise evaluations would probably give us more of a  
20      true picture, but our method of evaluation is one of  
21      teaching and coaching improvement in facilities rather  
22      than surprise inspections to -- to -- that could prove  
23      disruptive to the day-to-day operation. We do have  
24      latitude within our directive and I'm empowered by the  
25      director of air traffic to conduct surprise audits, if

1     you will, or surprise visits. We try to use them very,  
2     very sparingly, only in cases where we feel they're  
3     absolutely necessary.

4             MR. DUNHAM: And what would be one sort of  
5     typical situation that might provoke that?

6             THE WITNESS: The last one I recall was a  
7     non-Federal facility that we'd received complaints from  
8     the user community that they were providing services  
9     apparently using a radar that wasn't certified. We  
10    conducted a rather clandestine observation of that  
11    operation and indeed found that non-certificated  
12    equipment was in use and the controllers had not  
13    received training on it.

14            MR. DUNHAM: Have any no-notice evaluations  
15    been performed on an FAA facility?

16            THE WITNESS: Not in the past three or four  
17    years, no.

18            MR. DUNHAM: Could you please describe in  
19    general the functional areas examined in a typical  
20    evaluation?

21            THE WITNESS: Yes, there are four areas that  
22    are -- that are scrutinized. They are training,  
23    administration, quality assurance, and operations.

24            MR. DUNHAM: And then how are those -- the  
25    checklist items under those areas classified?

1 THE WITNESS: I'm sorry. I don't understand  
2 the question.

3 MR. DUNHAM: I'm looking for the -- the  
4 rating of each individual checklist item as  
5 commendable, etc.

6 THE WITNESS: Oh, I beg your pardon. The --  
7 each item is -- is either rated as satisfactory,  
8 commendable if -- if a particular degree of excellence  
9 is witnessed in that particular checklist item, or as a  
10 problem, a problem being denoted only in instances  
11 where an FAA handbook or regulation is -- is violated  
12 or in cases where we feel that -- that an extreme  
13 safety factor is -- is at risk.

14 MR. DUNHAM: And is there a fourth  
15 classification?

16 THE WITNESS: I'm sorry?

17 MR. DUNHAM: Is there another classification  
18 besides those?

19 THE WITNESS: I believe we covered  
20 informational, satisfactory, commendable, and problem.

21 MR. DUNHAM: Okay.

22 (Pause)

23 MR. DUNHAM: So, what standard was the MSAW  
24 item on the CERAP checklist being compared to when the  
25 evaluation team was looking at it?

1           THE WITNESS: There were two evaluations.  
2     The two most current evaluations accomplished at Guam  
3     were in 1995 and '97. The 1995 evaluation contained an  
4     informational item that the Guam MSAW had been disabled  
5     to the 54-55 mile ring that we've seen earlier. And  
6     that was based on non-delivery of a digital terrain  
7     map. We were advised by the facility that that was  
8     anticipated to arrive some months late and would  
9     rectify the problem that they were encountering with  
10    MSAW.

11           MR. DUNHAM: Okay. And in 1997 was the MSAW  
12    referred to at all?

13           THE WITNESS: The -- in 1997 there ~~was~~ no  
14    reference to the MSAW. It was not brought to our  
15    attention in the facility as a difficulty. Therefore,  
16    we did not identify it.

17           MR. DUNHAM: And the 1995 evaluation, which  
18    was Exhibit P like Papa, pages seven through 17 --  
19    excuse me, 16.

20           THE WITNESS: Say again the pages, please?

21           MR. DUNHAM: It's P seven through 16.

22           And in what -- what section is MSAW  
23    mentioned?

24           (Pause)

1 MR. DUNHAM: Page P14.

2 THE WITNESS: Thank you.

3 (Pause)

4 THE WITNESS: You're right. I didn't see it.  
5 It's at the bottom of the page. It -- the item does  
6 begin on page P14.

7 MR. DUNHAM: And what section of the report  
8 was that classified in?

9 (Pause)

10 THE WITNESS: It appears to be listed under  
11 the administrative segment of the report.

12 MR. DUNHAM: And then it was put in as an  
13 informational item?

14 THE WITNESS: Yes, it was.

15 MR. DUNHAM: And what -- what is the other  
16 item in that area that was classified as informational?

17 THE WITNESS: The other one has to do with  
18 FAA housing and difficulties regarding the FAA's  
19 ability to furnish Government-sponsored housing on  
20 Guam.

21 (Pause)

22 MR. DUNHAM: Can you describe the corrective  
23 actions and follow-up processes applied to  
24 informational items?

1           THE WITNESS: Informational items do not  
2 always require corrective action. By definition  
3 informational items are those that the evaluators feel  
4 need to be brought to the attention or could be of  
5 special interest to higher management.

6           MR. DUNHAM: So the inhibition of the MSAW  
7 functions at the Guam CERAP did not qualify as a  
8 problem under the FAA's evaluation standards?

9           THE WITNESS: No, sir. As stated earlier,  
10 there was no criteria by which it could be measured.  
11 Therefore, basically, it was in accordance with  
12 national standards.

13          MR. DUNHAM: Okay. Could you look at Exhibit  
14 3J, page 16?

15          THE WITNESS: I'm sorry?

16          MR. DUNHAM: That's 3J, page 16.

17          THE WITNESS: Oh. Thank you. Yes, I have  
18 it.

19          MR. DUNHAM: Okay. Paragraph 13-2-7E. Could  
20 you read the guidance for the facility managers in  
21 section three of that paragraph, please?

22          THE WITNESS: Yes. 13-2-7B says the facility  
23 air traffic managers --

24          MR. DUNHAM: Sorry. It's E.

1 THE WITNESS: I'm sorry.

2 MR. DUNHAM: -- sorry.

3 (Pause)

4 THE WITNESS: That's the paragraph that  
5 begins "Facility air traffic managers shall ensure  
6 that"?

7 MR. DUNHAM: Yes. And then section three of  
8 that.

9 THE WITNESS: "Three, MSAW parameters are  
10 modified as appropriate to minimize the extent of  
11 inhibit areas as specified in the NAS configuration  
12 management documents, NAS MD 633, NAS MD 643 for MSAW  
13 and site adaptation."

14 MR. DUNHAM: Okay. Did the 54-mile radius  
15 inhibited area found at Guam in 1995 meet that  
16 standard?

17 THE WITNESS: It did not. However, it did  
18 meet other criteria contained in this same handbook  
19 which allows facility managers to otherwise modify MSAW  
20 temporarily if it's disruptive to the operation. We  
21 were advised that was the action that had taken place.

22 MR. DUNHAM: And is there any standard for  
23 how many years temporary could be?

24 THE WITNESS: No, I can't define that.

1 MR. DUNHAM: Could you please look at Exhibit  
2 P, Papa, one through six, which is the 1997 Guam  
3 evaluation report.

4 (Pause)

5 THE WITNESS: Okay.

6 MR. DUNHAM: In this 1997 report there is no  
7 mention of MSAW. As we've discussed that generally  
8 would indicate that it was satisfactory?

9 THE WITNESS: That's correct.

10 MR. DUNHAM: Was it in fact functional at  
11 that time?

12 THE WITNESS: Based on what I've seen, no, it  
13 was not. It was --

14 MR. DUNHAM: It --

15 THE WITNESS: -- it -- excuse me. I stand  
16 corrected and say that yes, it was functional but for  
17 all intents and purposes it was useless being only  
18 functional for a one-mile radius.

19 MR. DUNHAM: Would the evaluation team have  
20 been aware of that having reviewed the '95 report?

21 THE WITNESS: We would not have been unless  
22 we were alerted by facility personnel. Software in --  
23 in the automation systems used by air traffic  
24 controllers, quality assurance is assured through  
25 configuration management, and I have no -- neither the

1 expertise nor the methodology to go in and check those  
2 systems.

3 MR. DUNHAM: Okay. In the '95 report the  
4 team was aware that the function was inhibited,  
5 correct?

6 THE WITNESS: Right.

7 MR. DUNHAM: The '97 team would have reviewed  
8 that report?

9 THE WITNESS: In all certainty, yes, they  
10 would have reviewed that report.

11 MR. DUNHAM: Would they have asked the simple  
12 question at that time of whether MSAW was functioning  
13 as intended?

14 THE WITNESS: I suspect that they either  
15 asked that question or they asked if the new digital  
16 terrain map had been installed, either one, which would  
17 have indicated to them that -- that this informational  
18 item no longer existed.

19 MR. DUNHAM: And so, the fact that the MSAW  
20 was not in fact working was of no particular concern to  
21 the evaluation?

22 THE WITNESS: No, sir, I would not say that.

23 I would say that they were not made aware of it or  
24 they had reason to believe that that situation had been  
25 corrected.

1 MR. DUNHAM: So you're saying that it was  
2 noted as inhibited in the '95 report and the '97 team  
3 wouldn't be aware of it?

4 THE WITNESS: I'm sorry. Say that again?

5 MR. DUNHAM: You're saying that in the '95  
6 evaluation where it was noted as inhibited the '97 team  
7 would not be aware that it had continued to be  
8 inhibited?

9 THE WITNESS: That is -- that's apparently  
10 what has happened, yes.

11 MR. DUNHAM: Okay.

12 (Pause)

13 MR. DUNHAM: In Exhibit R, take a look at  
14 that one, please. R like Robert.

15 (Pause)

16 MR. DUNHAM: Yeah, it's 3R.

17 THE WITNESS: Okay. Say again the number,  
18 please?

19 MR. DUNHAM: It's 3R like Robert. It's a  
20 safety recommendation.

21 (Pause)

22 THE WITNESS: R3?

23 MR. DUNHAM: Yeah, it's Exhibit R. It says  
24 1994 -- I believe it's November 21st, 1994, is the date  
25 on that.

1 THE WITNESS: Okay. Yeah, '94, 186 through  
2 188?

3 MR. DUNHAM: That's correct.

4 As Mr. Howell explained, that recommendation  
5 referred to some configuration problems with MSAW  
6 adaptations at Dulles Airport. It would -- would it be  
7 a function of the evaluation teams to go to a level  
8 where those problems would be detected or is that, as  
9 you said, only detectable through configuration  
10 management?

11 THE WITNESS: This sort of audit would be the  
12 initial responsibility of the office of primary  
13 interest, in this case either the air traffic  
14 requirements or the air traffic operations  
15 organizations. In cases where compliance is questioned  
16 my unit has been asked to go out specifically and --  
17 and check various features. But routinely, no, we  
18 would not have been involved in this response.

19 MR. DUNHAM: Okay. Wouldn't that  
20 recommendation -- whereas accepted by FAA, they replied  
21 to the Safety Board that they would be conducting a  
22 review in order to check the parameters as specified in  
23 that recommendation. As we've seen, that  
24 recommendation was apparently attempted but the review  
25 process did not actually succeed in locating those

1 problems. Does the FAA have any evaluation process  
2 that would track responses to safety recommendations to  
3 ensure that they've been completed properly?

4 THE WITNESS: Yes, and --and in my  
5 organization these are referred to as special emphasis  
6 items. For example, subsequent to the -- to the Guam  
7 accident Air Traffic Operations and AOS jointly asked  
8 us to go out and as a special emphasis item interview  
9 automation specialists in facilities to ascertain their  
10 level of compliance with national directives. This is  
11 something that will run for a year or two years based  
12 upon their request and then will expire.

13 MR. DUNHAM: Okay. That -- we'll talk about  
14 that more in a minute.

15 Do you know if, in reference to the 1994  
16 review, was there any sort of follow-up evaluation  
17 performed?

18 THE WITNESS: I don't know.

19 MR. DUNHAM: Does the Air Traffic Service  
20 have any quality assurance program in place other than  
21 facility evaluations that should have detected these  
22 chronic MSAW problems?

23 THE WITNESS: There are basically three  
24 evaluations-type processes in effect in Air Traffic  
25 Service. One is the one that I manage, which looks at

1     air traffic operational issues. Airways Facilities has  
2     a similar effort underway for compliance to national  
3     standards for hardware and so on and so forth. And  
4     then AOS maintains a separate quality assurance role in  
5     assuring the quality of the -- of the software that  
6     they develop.

7             MR. DUNHAM: But at the time of the Guam  
8     accident that software was actually the responsibility  
9     of Air Traffic Service as far as its functionality,  
10    correct?

11            THE WITNESS: I -- I believe it was in  
12    transit, so I would hesitate to say precisely whose  
13    responsibility it was on that given day.

14            MR. DUNHAM: Was your office responsible for  
15    that item before the transition?

16            THE WITNESS: For what item?

17            MR. DUNHAM: The MSAW quality.

18            THE WITNESS: No. As -- as far as the  
19    software?

20            MR. DUNHAM: Well, if it belonged -- I'm  
21    trying to establish that you're saying that we're not  
22    sure whether it belonged to Air Traffic or Airway  
23    Facilities.

24            THE WITNESS: No, the organization I head has  
25    never had responsibility for -- for auditing MSAW or

1 any other operational software. We -- we will, if made  
2 known by the -- by the people who use it, certainly  
3 identify it to the organization that has primary  
4 interest over it. But again, quality assurance is  
5 assured mainly through -- through configuration  
6 management.

7 MR. DUNHAM: Okay. So on the -- at the time  
8 of the Guam accident, who was the office of primary  
9 responsibility for MSAW configuration?

10 THE WITNESS: It was somewhere between the  
11 ATO, the ATR, and the AOS organization. And I -- I  
12 can't tell you with precision.

13 MR. DUNHAM: All right. So dyou know --  
14 are you aware of who would have been responsibility --  
15 or who would have been responsible for oversight of the  
16 work of local automation specialists?

17 THE WITNESS: Again, because the transition  
18 between Air Traffic and AOS was taking place I'd be  
19 guessing.

20 MR. DUNHAM: Well, the automation specialists  
21 are and remain Air Traffic employees, correct?

22 THE WITNESS: They are, yes.

23 MR. DUNHAM: Okay. So wouldn't that put the  
24 responsibility for their work with Air Traffic?

1           THE WITNESS: It --it should but again,  
2     because of the transition I'm not sure. There were  
3     various responsibilities being transitioned over from  
4     AT to AOS. I was not intimately familiar with -- with  
5     that transition or how it was taking place so I can't  
6     speak to it with any authority.

7           MR. DUNHAM: All right. I think we'll skip  
8     that one.

9           The evaluational order that the teams use  
10    when they go to the field provides standards references  
11    for various checklist items. How are those standards  
12    selected?

13          THE WITNESS: They're redesigned first and  
14    foremost based on requirements contained in the  
15    controller's handbook 7110.65. Also, facility  
16    operations and administration and other air traffic  
17    documents. The checklist is -- is updated frequently  
18    because of the number of manuals that references, they  
19    change on different cycles. Therefore, maintaining the  
20    references for each and every item is -- is somewhat of  
21    a difficult chore.

22          We also accept input from both air traffic  
23    users and air traffic providers and the services who --  
24    who direct and develop air traffic policy for special  
25    emphasis items and areas of current concern that we

1 look at.

2 MR. DUNHAM: So, is the objective in  
3 selecting the standards to ensure that that checklist  
4 item is functionally acceptable or simply meets some  
5 administrative standards or operationally useful  
6 standards?

7 THE WITNESS: Could you repeat that, please?

8 MR. DUNHAM: Let me rephrase it. The -- the  
9 standard, for example, on the checklist for MSAW as  
10 you've stated refers to the facility operation and  
11 administration guide, and the guidance in that manual  
12 is very general. For some example, the EARTS III  
13 systems, there are specific configuration management  
14 documents which ensure the performance of MSAW is  
15 according to standard. Those references are not part  
16 of the standards that are used on the checklist.

17 THE WITNESS: I still didn't understand the  
18 last sentence you said.

19 MR. DUNHAM: The -- the standard on the  
20 checklist item for compliance --

21 THE WITNESS: Mm-hmm.

22 MR. DUNHAM: -- is not the technical  
23 reference for MSAW. It's instead a general management  
24 reference --

1 THE WITNESS: Right.

2 MR. DUNHAM: -- which doesn't necessarily  
3 ensure that the configuration meets performance  
4 standards for MSAW. Is that normal?

5 THE WITNESS: Yeah. Again -- again,  
6 considering that -- that this evaluation is aimed only  
7 at -- at operational compliance with national  
8 standards, the technical standards under which MSAW is  
9 written and governed would -- would be a matter for  
10 those developing the software to monitor. Again, I  
11 don't have the expertise with me along on evaluation  
12 trips to go into that level of detail in the automation  
13 software programs.

14 MR. DUNHAM: Okay. Does your office have any  
15 responsibility for developing the FAA response to the  
16 1994 safety recommendation we spoke of a minute ago?

17 THE WITNESS: My office today did not exist  
18 in 1994 when that response was crafted.

19 MR. DUNHAM: Mm-hmm.

20 THE WITNESS: I was affiliated with -- with  
21 the -- as a matter of fact, I was the director of the  
22 prior organization, the Office of Air Traffic System  
23 Effectiveness. We would have been involved in fielding  
24 the question. However, the actual response would have  
25 been written probably by the Air Traffic Requirements

1 Organization at that time.

2 MR. DUNHAM: Okay. Have you made any changes  
3 to the evaluation process in response to the Korean Air  
4 accident or any issues arising from it?

5 THE WITNESS: Yes, we have. As Mr. Howell  
6 described to you, our plans for -- for future  
7 configuration management of software built for MSAW as  
8 an interim measure, we've -- my office has sat down  
9 jointly with Air Traffic Operations. We've come up  
10 with a list of -- of questions which we now pose to  
11 automation specialists within a facility to try to  
12 measure compliance. I'll be candid and tell you it's -  
13 - it's not a perfect system and that's why we're  
14 working towards one of -- of tighter configuration  
15 management because it's going to be the only -- the  
16 only solid cure to what we're trying to achieve.

17 MR. DUNHAM: All right. No further  
18 questions.

19 CHAIRMAN FRANCIS: KCAB?

20 MR. LEE: Thank you, Chairman. Chairman, I  
21 have no questions. Thank you.

22 CHAIRMAN FRANCIS: Thank you.  
23 Boeing Company?

24 MR. DARCY: We have no questions, Mr.  
25 Chairman.

1 CHAIRMAN FRANCIS: Barton ATC?

2 MR. E. MONTGOMERY: No questions.

3 CHAIRMAN FRANCIS: Korean Air?

4 CAPT. KIM: I have one question. My official  
5 assistant ask you.

6 FIRST OFFICER CHUNG: Our question involves  
7 -- and thank you, Mr. Canoles. If the Guam Tower  
8 controller theoretically had used the D-BRITE facility  
9 in your judgment -- I'm not sure if we're asking the  
10 right person -- but would this have been a breach of  
11 FAA regulations since it was not commissioned? And if  
12 that's not a fair question, you don't have to answer  
13 it.

14 THE WITNESS: I -- I would respond and say  
15 that -- that we do not allow the use of non-certified  
16 air traffic equipment as -- as we wouldn't allow  
17 someone to fly a non-certified aircraft. Until it was  
18 certified to meet certain stringent safety and accuracy  
19 requirements we would -- we would not allow it nor we  
20 would encourage it or allow it.

21 FIRST OFFICER CHUNG: So in essence you would  
22 not allow -- they would not be authorized to use D-  
23 BRITE equipment as it was?

24 THE WITNESS: That's correct. They would be  
25 told not to use it.

1 FIRST OFFICER CHUNG: Thank you.

2 CHAIRMAN FRANCIS: Government of Guam?

3 MR. DERVISH: Thank you. No questions.

4 CHAIRMAN FRANCIS: NATCA?

5 MR. MOTE: Thank you, Mr. Chairman. No  
6 questions.

7 CHAIRMAN FRANCIS: FAA?

8 MR. DONNER: Thank you, sir. No questions.

9 CHAIRMAN FRANCIS: Mr. Feith?

10 MR. FEITH: No questions.

11 CHAIRMAN FRANCIS: I just -- I guess I'd ask  
12 one question, and it refers back to some of the things  
13 that Scott was talking about. This is the issue of --  
14 of where an evaluation office, quality assurance office  
15 reports within an organization. Has the FAA ever  
16 considered that your office reporting somewhere other  
17 than to -- to the AT 1 or who -- to whom do you report,  
18 I guess is --

19 THE WITNESS: Mr. -- Mr. Chairman, I do  
20 report to AT 1. Air Traffic --

21 CHAIRMAN FRANCIS: I'm not trying to -- to  
22 take a piece out of my friend Mr. Morgan's hide here.  
23 I --

24 THE WITNESS: Thank you.

1           CHAIRMAN FRANCIS:  -- I think it's an  
2     important question.

3           THE WITNESS:  Thank you, sir, and I'll tell  
4     him you said that.

5           We have -- we have never moved to do it.  We  
6     -- we once had a direction from the secretary of  
7     Transportation which caused us to take it out of Air  
8     Traffic.  The head of Air Traffic at that time, Bill  
9     Pollard, was successful and prevailed with the next  
10    secretary to bring it back.  We realized that there is  
11    -- there is the potential for being too close to topics  
12    being employed in the same organization.  However, we  
13    feel that that is more than adequately balanced by the  
14    fact that we can maintain a work force of fresh,  
15    current people who are -- are capable of evaluating  
16    today's current issues in air traffic.

17          CHAIRMAN FRANCIS:  I guess I'd say that, you  
18    know, we -- we spend a lot of time in this industry --  
19    again, and this is not just with the FAA, but we talk a  
20    lot, to -- to airlines particularly, about the  
21    importance of their safety departments not reporting  
22    through operations because there is a potential  
23    conflict but rather reporting directly to the CEO of  
24    the organization, so I -- I would like to -- to I guess  
25    suggest to the FAA that they might want to at least

1 take a look at this. I'm not sure that Jane Garvey  
2 needs any more people reporting to it either, but --  
3 but it's a -- it's an extraordinarily important  
4 question and I think that the questioning here  
5 indicates that we do have some concerns in this area.

6 THE WITNESS: Again, sir, I think Mr. Morgan  
7 has moved to that. He -- he has established me as an  
8 officer reporting directly to him. Prior to that we  
9 were a service in competition for resources with other  
10 air traffic services. So, as -- as a peer to the  
11 directors who set policy in air traffic, I certainly  
12 have a free voice and can get to him with -- with any  
13 degree of urgency I demand to -- to bring issues to his  
14 -- to his office.

15 CHAIRMAN FRANCIS: Thanks very much for your  
16 testimony.

17 THE WITNESS: Yes, sir.

18 (Whereupon, the witness was excused.)

19 CHAIRMAN FRANCIS: Now we will -- I'm sure  
20 that there's nobody here that's at all interested in  
21 taking a break, but I'm going to dictate it anyway.  
22 We'll take a break. It's -- until 4:00.

23 (Whereupon, a brief recess was taken.)

24 CHAIRMAN FRANCIS: All right. Our -- our  
25 next witness is Mr. Carl Schellenberg, the director of

1 Potomac Tracon Development, FAA in Washington.

2 Whereupon,

3 CARL SCHELLENBERG

4 was called as a witness, and first having been duly  
5 sworn, was examined and testified as follows:

6 TESTIMONY OF

7 CARL SCHELLENBERG

8 DIRECTOR

9 POTOMAC TRACON DEVELOPMENT, ATS-20

10 FEDERAL AVIATION ADMINISTRATION

11 WASHINGTON, D.C.

12 MR. SCHLEEDE: Mr. Schellenberg, please give  
13 us your full name and business address for the record?

14 THE WITNESS: My full name is Carl B.  
15 Schellenberg. My business address is FAA Headquarters,  
16 800 Independence Avenue, Washington, D.C.

17 MR. SCHLEEDE: And what is your present  
18 position with the FAA?

19 THE WITNESS: I'm sorry. I couldn't hear  
20 you.

21 MR. SCHLEEDE: What is your present position  
22 with the FAA?

23 THE WITNESS: My present position is director  
24 of the Potomac Program.

1           MR. SCHLEEDE: Would you give us a brief  
2 description of your education, training, and experience  
3 that brings you to your present position?

4           THE WITNESS: Yes. I have a Bachelor of Arts  
5 degree, Juris Doctor degree, and Master of Management  
6 degree. I've been employed by the Federal Aviation  
7 Administration for 29 years. I have served in  
8 capacities within the legal organization as regional  
9 counsel, chief of regulations and enforcement. I have  
10 served as deputy regional administrators in two  
11 regions. I was regional administrator in FAA's Western  
12 Pacific region. I have been director of System  
13 Capacity and Requirements. And in the immediate time  
14 of this accident and the aftermath I was acting as  
15 deputy associate administrator for Air Traffic  
16 Services.

17           CHAIRMAN FRANCIS: We -- we appreciate your  
18 only mentioning half of the positions that you've held  
19 in the FAA.

20           THE WITNESS: Thank you, Mr. Francis.

21           MR. SCHLEEDE: Thank you. Mr. Dunham will  
22 continue the questioning.

23           MR. DUNHAM: So, at the time of the accident  
24 you were deputy director for Air Traffic?

1 THE WITNESS: Deputy associate administrator  
2 for Air Traffic Services.

3 MR. DUNHAM: All right. Deputy associate  
4 administrator, okay.

5 To -- to start off kind of a follow-up from  
6 the -- the previous witness. Can you tell me who the  
7 automation specialists work for?

8 THE WITNESS: At what time?

9 MR. DUNHAM: At the time of the Korean Air  
10 accident.

11 THE WITNESS: At the time of the Korean Air  
12 accident the automation specialists were part of the  
13 Air Traffic Organization.

14 MR. DUNHAM: And who was responsible for  
15 overseeing their work?

16 THE WITNESS: Under those circumstances the  
17 Air Traffic Organization, the director of Air Traffic  
18 was responsible for that and the associate  
19 administrator for Air Traffic Services -- was  
20 responsible for direction above that.

21 MR. DUNHAM: So, at a -- let's go to a lower  
22 level. Were they reporting to the facility manager?  
23 You know, I'm trying to figure out who -- who would  
24 have been responsible for their quality assurance of  
25 their work.

1           THE WITNESS: Well, you -- let's talk two  
2 things. You talked about the reporting relationship of  
3 the automation specialists. That was a reporting  
4 relationship to the air traffic facility manager within  
5 that facility.

6           At the time of this accident, however, there  
7 was because of the policy that existed at that time  
8 some lack of clarity in who had the overall quality  
9 assurance requirements for assuring that the integrity  
10 of programs such as MSAW.

11          MR. DUNHAM: So, does that mean they weren't  
12 working for anyone who was actually responsible for the  
13 quality of their work?

14          THE WITNESS: That means that -- that there  
15 was no single entity at that point clearly responsible  
16 for the quality of programs and the total service  
17 delivery of -- of the MSAW program. That has since  
18 been changed.

19          MR. DUNHAM: Okay. Thank you.

20          To your knowledge, were there any concerns  
21 within FAA about MSAW performance before the Korean Air  
22 accident?

23          THE WITNESS: While there were, of course,  
24 continuing concerns about the program, major concerns  
25 about MSAW started with the investigation following

1     this accident.

2                 MR. DUNHAM:   How about before the accident?

3                 THE WITNESS:   Well, as I said, there were  
4     continuing concerns.  There were items that you've  
5     mentioned previously in testimony with regard to the  
6     recommendations of the Board, and we were, of course,  
7     concerned with the program at that point.  That concern  
8     escalated dramatically following this instance.

9                 MR. DUNHAM:   Okay.  What -- what remedial  
10    efforts were in progress before the accident, if any?

11                THE WITNESS:   Well, the efforts that we had  
12    talked about, some of the things that you have  
13    mentioned on some of the safety recommendations, those  
14    kinds of efforts were the continuing remedial efforts  
15    with regard to MSAW.

16                MR. DUNHAM:   Okay.  So, after the -- the 1994  
17    review, for example, was there any management oversight  
18    to see if that review had been effective?

19                THE WITNESS:   Was there any management  
20    oversight?  Yes, there was.

21                MR. DUNHAM:   And what was the assessment of  
22    the management as far as the quality of that review?

23                THE WITNESS:   Well, I -- you -- I have to --  
24    I have to answer as of a point in time.  If you ask me  
25    was there management oversight, yes, I will tell you.

1 If you ask me as of today am I satisfied with the  
2 extent of the management oversight that was exercised  
3 at that time, I am not. That's why we have changed it  
4 and -- and improved it.

5 MR. DUNHAM: All right. And what will FAA be  
6 doing to ensure that MSAW performance does not  
7 deteriorate?

8 THE WITNESS: Well, there are variety of  
9 things that we have done. First of all, we've  
10 established clear responsibility in a single  
11 organization for all of the aspects relating to MSAW,  
12 its performance, and its continued performance. That  
13 organization has established a number of very important  
14 pieces -- Mr. Howell testified to them earlier -- such  
15 as the establishment of a -- of criteria and standards  
16 against which MSAW performance will continue to be  
17 gauged and implemented. He's mentioned to you  
18 standards by which he will go back and do periodic  
19 updates against those standards to ensure that that  
20 performance continues. He's developed a variety of  
21 automated techniques and tools to quickly, promptly,  
22 and accurately determine the performance of all the M-  
23 site -- MSAW facilities.

24 In addition, we've developed flight  
25 inspection protocols and criteria to supplement that

1 effort so that with the clear-cut responsibility, the  
2 tools, and the standards we feel we have at this point  
3 a far better policy, guidance, and direction of the  
4 MSAW system.

5 MR. DUNHAM: Okay. So, does FAA plan to  
6 continue to provide AOS with the level of support  
7 required to maintain the quality of that program?

8 THE WITNESS: Yes.

9 MR. DUNHAM: Okay. After this  
10 reorganization, do you still plan to continue to have  
11 automation specialists in the field facilities?

12 THE WITNESS: There will be a -- a change in  
13 the role of the specialists in the facilities to a  
14 multi-function approach and -- and responsibility. We  
15 have transitioned and increased the level of support in  
16 the AOS organization for accomplishing what previously  
17 was work done by the automation specialists. So there  
18 will be some decrease in the -- of the level and  
19 numbers of people within the air traffic organization.

20 That now will be covered and accomplished by the AOS  
21 organization to replace that and improve that effort.

22 MR. DUNHAM: So there will still be people in  
23 the field with responsibility for some automation  
24 issues?

1 THE WITNESS: That is correct.

2 MR. DUNHAM: Will those people have access to  
3 sufficient training to ensure they're competent at  
4 that?

5 THE WITNESS: Yes.

6 (Pause)

7 MR. DUNHAM: And a more general question. In  
8 response to the earlier recommendation we discussed  
9 that provoked the 1994 review, the Safety Board  
10 received a letter from the FAA in response to that  
11 saying that this review had been completed. As that's  
12 been testified to today it was something less than  
13 effective. What policy changes do you anticipate to  
14 ensure that the Board can have confidence in responses  
15 from the FAA to a safety recommendation?

16 THE WITNESS: Let me answer that this way,  
17 Mr. Dunham. What we did following the '94 request I  
18 think was a good faith attempt to try to get a -- an  
19 accurate and complete response back to the Board. What  
20 we have learned since then and as a product of -- of  
21 our efforts following this particular accident that in  
22 the case of -- of issues involving complex systems such  
23 as MSAW and its adaptation to simply pull each of the  
24 offices and ask them if in fact they meet all the  
25 established criteria is not a satisfactory means to

1 really test whether that system is doing what it needs  
2 to do. That's why we have made the change,  
3 particularly the ones Mr. Howell testified to, so that  
4 in the future where we have to -- to respond and -- and  
5 describe the -- the state of the system in such complex  
6 systems we will use a similar process to that which we  
7 have described here where necessary.

8           There are some circumstances with less  
9 complex issues where such a polling can get a rapid,  
10 quick response of the status of individual items. In  
11 those cases we will continue to use that kind of  
12 process. What we will do is -- is exercise better  
13 judgment as to which of the tools works well under the  
14 particular circumstance we're trying to respond to. We  
15 learned a lot as a result of this.

16           MR. DUNHAM: And the FAA runs a -- a fairly,  
17 you know, decentralized organization. There are lots  
18 of facilities out there responsible for different  
19 functions. Even after receiving such a response from a  
20 facility will there be any formal follow-up efforts as  
21 part of the facility evaluation process or some other  
22 evaluation process to verify that that item has in fact  
23 been complied with?

24           THE WITNESS: Yes. We will use a combination  
25 of -- of the means that are most effective. In this

1 particular case we're talking about MSAW. The -- the  
2 -- the use of -- of an evaluation program is probably  
3 not the most effective means to ensure the continued  
4 integrity of that system. The responsibility assigned  
5 to a specific focal point as we have, the techniques  
6 and tools Mr. Howell testified is a superior way,  
7 really, to keep the status of that system up-to-date  
8 and current and -- and known rather than using an  
9 evaluation process.

10 There are -- there are pieces of the  
11 evaluation process that will work well with that new  
12 system. What we will do is try to have the optimum mix  
13 of those two to stay on top of the issues. So there  
14 will be some pieces on an emphasis basis that Mr.  
15 Canoles and -- and his organization will continue to  
16 do, but the real driver in keeping track of the  
17 performance of MSAW will lie with the AOS organization.

18 MR. DUNHAM: All right. Can you describe  
19 FAA's future plans for management of air traffic-  
20 related software?

21 THE WITNESS: Our future plans for the  
22 management of air traffic-related software?

23 MR. DUNHAM: Yes.

24 THE WITNESS: As I indicated to you before,  
25 we are -- we have transitioned and moved most of that

1 responsibility for air traffic-related software into  
2 the AOS organization to administer and maintain it with  
3 some support left within the Air Traffic Organization  
4 to provide the necessary field connectivity to make  
5 that happen. That's the general structure of the way  
6 we're going to proceed for the other systems, if I  
7 understood your question.

8 MR. DUNHAM: All right. I'm looking at the  
9 -- the more general issue of not just MSAW but are  
10 you -- your intention is to effectively place AOS in  
11 charge of all air traffic-related software management?

12 THE WITNESS: That is the -- that is the  
13 transitional step that we are referring to, yes.

14 MR. DUNHAM: Okay. And that'll continue with  
15 the STARS program and anything else that comes in later  
16 on?

17 THE WITNESS: It will occur in -- in the  
18 optimum blend with all those programs, yes.

19 MR. DUNHAM: Okay. No further questions.

20 THE WITNESS: Thank you.

21 CHAIRMAN FRANCIS: KCAB?

22 MR. LEE: Thank you, Chairman. No questions.  
23 Thank you.

24 CHAIRMAN FRANCIS: NATCA?

1 MR. MOTE: Thank you, Mr. Chairman. No  
2 questions.

3 CHAIRMAN FRANCIS: Government of Guam?

4 MR. DERVISH: Thank you. No questions.

5 CHAIRMAN FRANCIS: Korean Air?

6 CAPT. KIM: No, thank you, sir.

7 CHAIRMAN FRANCIS: Barton ATC?

8 MR. E. MONTGOMERY: No questions, Mr.  
9 Chairman.

10 CHAIRMAN FRANCIS: Boeing Company?

11 MR. DARCY: We have no questions, Mr.  
12 Chairman.

13 CHAIRMAN FRANCIS: Mr. Feith?

14 MR. FEITH: No.

15 CHAIRMAN FRANCIS: Carl, we shouldn't let you  
16 off this easily.

17 THE WITNESS: Why not?

18 (Laughter)

19 CHAIRMAN FRANCIS: Oh, sorry. Mr. Donner.  
20 You've been so -- you've been so non-responsive all day  
21 long I forgot all about you.

22 MR. DONNER: Thank you for finally  
23 recognizing the FAA, sir. We have no questions either.

24 (Laughter)

1           CHAIRMAN FRANCIS: Why does that not surprise  
2 me?

3           I guess I'd just say Carl, and we talked a  
4 little bit about this at the break, the question of the  
5 evaluation and quality assurance function that I  
6 mentioned to Mr. Canoles. I think that this is  
7 something that's interested and interesting, important,  
8 and I hope you folks will be looking at.

9           THE WITNESS: Yes, Mr. Francis. We continue  
10 to -- to examine that. As -- as you and I chatted, the  
11 reporting relationship has been in a variety of places  
12 when -- within the FAA. That location of the reporting  
13 relationship does not necessarily ensure success of the  
14 program. It's terribly critical we have the right  
15 people administering the program regardless of where  
16 the reporting relationship, and that's the really most  
17 important base.

18           CHAIRMAN FRANCIS: Thanks very much.

19           THE WITNESS: Thank you.

20           (Whereupon, the witness was excused.)

21           CHAIRMAN FRANCIS: Next witness will be Lewis  
22 Zeigler, who is the principal operations inspector for  
23 KAL, the Flight Standards District Office in San  
24 Francisco. Mr. Zeigler will be the last witness today.

1

2

3

4 Whereupon,

5

LEWIS ZEIGLER

6

was called as a witness, and first having been duly

7

sworn, was examined and testified as follows:

8

TESTIMONY OF

9

LEWIS ZEIGLER

10

KOREAN AIR GEOGRAPHIC OPERATIONS INSPECTOR

11

FAA FLIGHT STANDARDS DISTRICT OFFICE

12

SAN FRANCISCO, CALIFORNIA

13

MR. SCHLEEDE: Mr. Zeigler, please give us

14

your full name and business address for the record?

15

THE WITNESS: Lewis I. Zeigler. The business

16

address is 831 Nitten Road, Burlingame, California,

17

94010.

18

MR. SCHLEEDE: And you work for the FAA?

19

THE WITNESS: Yes, sir. I do.

20

MR. SCHLEEDE: In what position?

21

THE WITNESS: I'm a international geographic

22

inspector at the San Francisco International Field

23

Office.

24

MR. SCHLEEDE: Could you give us a brief

25

description of your training, education, and experience

1 that brings you to that present position?

2 THE WITNESS: I have a bachelor of arts  
3 degree. I'm a retired Marine Corps aviator. I flew  
4 commercially for 10 years. I've been with the FAA for  
5 a little more than 12 years. And I've been an  
6 international geographic inspector for the last 10  
7 years and five months.

8 MR. SCHLEEDE: Thank you. Captain Misencik?

9 CAPTAIN MISENCIK: Hello, Mr. Zeigler.

10 Prior to working in the western area you were  
11 a geographic inspector in Europe, I believe, weren't  
12 you?

13 THE WITNESS: Yes, sir. I was.

14 CAPTAIN MISENCIK: How long were you over  
15 there?

16 THE WITNESS: Seven years.

17 CAPTAIN MISENCIK: And how long have you been  
18 now in -- working out of California?

19 THE WITNESS: Since the first of October of  
20 1994.

21 CAPTAIN MISENCIK: Okay. At the time of the  
22 accident last July what international carriers were you  
23 responsible for for providing oversight?

24 THE WITNESS: I had Air Nehru, Korean  
25 Airlines, Asiana Airlines, Garuda, Malaysia, Japan Air

1 Charter, and Japan Air System.

2 CAPTAIN MISENCIK: Are you still providing  
3 oversight for Korean Airlines?

4 THE WITNESS: No, sir. I am not.

5 CAPTAIN MISENCIK: What airlines do you  
6 oversee at this time?

7 THE WITNESS: I have Air China, China  
8 Eastern, China Southern, All Nipon, Nipon Cargo, and I  
9 have the geographic responsibility for one of the  
10 Mexican airlines who we don't hold the op specs for  
11 'em, Allegro.

12 CAPTAIN MISENCIK: When did you cease  
13 providing oversight for Korean Air?

14 THE WITNESS: In October '97.

15 CAPTAIN MISENCIK: Was that a scheduled  
16 transition or --

17 THE WITNESS: No, sir. We -- usually once a  
18 year or every two years we kind of rotate the airlines  
19 around to the different inspectors, but in this case we  
20 had an inspector that retired so we had to redivide all  
21 the airlines up. And then after that we had another  
22 new inspector came in the office some years later, so  
23 we ended up having to divvy 'em up again.

24 CAPTAIN MISENCIK: Concerning Part 129  
25 oversight, how is Part 129 authority granted to foreign

1 airlines?

2 THE WITNESS: It's through the IKO and the  
3 FAA grants the -- well, IKO grants the U.S. Government  
4 the authority to inspect foreign airlines.

5 CAPTAIN MISENCIK: But who grants the -- the  
6 certificate? Is that the -- the FAA?

7 THE WITNESS: The FAA.

8 CAPTAIN MISENCIK: I understand. Does any  
9 other agency have any authority in granting Part 129  
10 authority?

11 THE WITNESS: Only the Economic Authority,  
12 which is invested with the Department of  
13 Transportation.

14 CAPTAIN MISENCIK: How is being responsible  
15 for Part 129 oversight similar and different from Part  
16 129 oversight?

17 THE WITNESS: You mean Part 121?

18 CAPTAIN MISENCIK: I'm sorry. How does Part  
19 120 -- how is it different from Part 121, being a Part  
20 121 --

21 THE WITNESS: Well, there are some  
22 similarities in that we do some of the same types of  
23 inspections, such as ramp inspections, station facility  
24 inspections, trip records inspections. We issue op  
25 specs. But in the case with the 121 carrier, you have

1 the responsibility of approving all their training  
2 programs, all their manuals, lots of things that we do  
3 not have the authority to do under 129.

4 CAPTAIN MISENCIK: Who approves the -- who  
5 handles the oversight that normally would be provided  
6 for under Part 121 that -- that you don't do under Part  
7 129?

8 THE WITNESS: The foreign government civil  
9 aviation authorities of whatever country we're talking  
10 of.

11 CAPTAIN MISENCIK: Just backtracking a  
12 little, when you were providing oversight at the time  
13 of the accident for Korean Air and all of the other  
14 carriers, how many airplanes normally were -- would you  
15 estimate that that included at that time?

16 THE WITNESS: You mean how many aircraft?  
17 That's -- my airlines have?

18 CAPTAIN MISENCIK: Yes.

19 THE WITNESS: I have no idea. It's quite a  
20 few.

21 CAPTAIN MISENCIK: Okay. Do you have any  
22 oversight responsibility regarding ground and flight  
23 training at all with foreign carriers?

24 THE WITNESS: No, sir. We do not.

1           CAPTAIN MISENCIK: Do you have any basic  
2     fundamental knowledge or any requirement to have basic  
3     or fundamental knowledge of the general operations  
4     manual or any of the -- the flight operations  
5     procedures for the foreign carriers?

6           THE WITNESS: No, sir. We don't.

7           CAPTAIN MISENCIK: Do you do en route  
8     inspections on the foreign carriers you oversee?

9           THE WITNESS: No, sir. We do not.

10          (Pause)

11          CAPTAIN MISENCIK: The -- the responsibility  
12     that you have under Part 129 or -- or actually, the --  
13     the responsibilities that you share with the foreign  
14     governments, what -- what defines those  
15     responsibilities? Is there a document or the sharing  
16     of responsibilities, the --

17          THE WITNESS: I --

18          CAPTAIN MISENCIK: -- 129.

19          THE WITNESS: The IKO articles and the  
20     annexes grant us the authority to inspect aircraft  
21     within the United States, and our FAA handbooks and  
22     other orders tell us how we do our job.

23          CAPTAIN MISENCIK: What incentive is there  
24     for Part 129 air carriers to comply with Federal  
25     Aviation regulations?

1 THE WITNESS: I'm sorry, sir. Would you --

2 CAPTAIN MISENCIK: I said what incentive is  
3 there for foreign airlines to comply with our  
4 regulations? What --

5 THE WITNESS: Well, they -- the incentive is  
6 if they want to operate in the United States then they  
7 must comply with the IKO rules and Air FAR 129.

8 CAPTAIN MISENCIK: Okay. What procedure --  
9 by which procedure are concerns, letters of  
10 investigation, or violations handled concerning foreign  
11 carriers that are operating under Part 129?

12 THE WITNESS: You mean how we go about doing  
13 a violation?

14 CAPTAIN MISENCIK: Yes.

15 THE WITNESS: Well, if we were to uncover  
16 something wrong we would initiate a violation or  
17 enforcement package. It would then go to the regional  
18 counsel's office, and it's handled by the regional  
19 counsel. They then forward it to Washington. I think  
20 from Washington it goes to the State Department and  
21 thence to the foreign government.

22 CAPTAIN MISENCIK: How does the -- how is the  
23 airline itself notified of this letter of investigation  
24 or -- or violation?

1           THE WITNESS: Well, at the time we initiate  
2 the investigation we do send a letter of investigation  
3 to the airline or to the individual pilot if it was a -  
4 - a violation against the pilot himself. And generally  
5 speaking, we would also send a copy of that to the  
6 foreign civil aviation authorities so that they would  
7 at least be informed that it was -- what was going on.

8           CAPTAIN MISENCIK: In your experience, how  
9 have the foreign carriers that you oversee responded to  
10 LOIs or enforcement actions or other discrepancies that  
11 you have brought to their attention?

12          THE WITNESS: Well, if you're asking do they  
13 ever respond, yes, they do. I've always gotten an  
14 answer back from the airline.

15          CAPTAIN MISENCIK: Well, have they responded  
16 in a manner consistent with, say, the way U.S. carriers  
17 would respond to LOIs or other enforcement action?

18          THE WITNESS: Yes, sir.

19          CAPTAIN MISENCIK: Do you do ramp checks also  
20 on foreign carriers?

21          THE WITNESS: Yes, sir. We do.

22          CAPTAIN MISENCIK: Have you ever been refused  
23 admittance to an aircraft or -- or a facility by  
24 foreign -- a foreign airline?

1 THE WITNESS: No, sir. I have not.

2 CAPTAIN MISENCIK: If you would be refused  
3 admittance to an aircraft, how would that be -- what  
4 would be your marching orders?

5 THE WITNESS: Well, I -- first thing I would  
6 do, inform the captain, remind him of the fact that IKO  
7 regulations give us the authority to inspect his  
8 aircraft and his crew and recommend that he maybe  
9 change his mind about allowing me to inspect him.  
10 Should he not do so, I would inform him that the first  
11 action I would take would be to inform the civil  
12 aviation authorities of his government that I'm being  
13 denied access. I would also open an investigation for  
14 filing a violation against him. And hopefully they  
15 would change their minds. If they didn't, then that's  
16 what I would do.

17 CAPTAIN MISENCIK: Do you normally -- or how  
18 do you interact with the KCAB in oversight of Korean  
19 Airlines or when you were overseeing Korean Airlines?  
20 Was there a -- a flow of information between the two  
21 government agencies?

22 THE WITNESS: Not generally speaking, but on  
23 a couple occasions where we discovered a problem are  
24 there I did send a -- a letter to the KCAB to inform  
25 'em of what we had found.

1 CAPTAIN MISENCIK: Uh huh. Do you receive  
2 reports of KCAB concerns or -- with -- or did you  
3 receive reports of KCAB concerns with Korean Airlines?

4 THE WITNESS: No, sir.

5 CAPTAIN MISENCIK: Do you receive -- or were  
6 you furnished copies of Korean Air manuals, operational  
7 procedures, or -- or any other materials from the  
8 airline?

9 THE WITNESS: No, sir. We do not.

10 CAPTAIN MISENCIK: Are they required or why  
11 didn't you receive them --

12 THE WITNESS: No, sir. They -- we're --  
13 we're -- they're not required to submit copies of their  
14 manuals to us. The only exception to that would be if  
15 the airline was operating a U.S.-registered aircraft.  
16 Then the FAA has to improve the maintenance program and  
17 the MEL for that aircraft.

18 CAPTAIN MISENCIK: The -- is it required or  
19 -- that you send reports of your inspection  
20 activities concerning Korean Air to the KCAB?

21 THE WITNESS: No, sir. There is no  
22 requirement.

23 CAPTAIN MISENCIK: So essentially, there is  
24 no requirement for an exchange of information between  
25 the -- the two overseeing agencies?

1 THE WITNESS: No, sir.

2 (Pause)

3 CAPTAIN MISENCIK: With the airlines that you  
4 were overseeing at the time that you were providing  
5 oversight to Korean Air, how did Korean Air compare  
6 with the other airlines you were overseeing as far as  
7 discrepancies, concerns, LOIs?

8 THE WITNESS: Average.

9 CAPTAIN MISENCIK: Uh huh.

10 THE WITNESS: No better, no worse, you know.

11 CAPTAIN MISENCIK: There -- the discrepancies  
12 that manifested themselves at Korean Air, did they  
13 differ either in quantity or nature from any of the  
14 other airlines?

15 THE WITNESS: No, sir.

16 CAPTAIN MISENCIK: During the time period you  
17 were overseeing Korean Air, how many letters of  
18 investigation, violations, or enforcement actions did  
19 you initiate against them?

20 THE WITNESS: I initiated one violation, a  
21 second one was to one of their pilots, and that one was  
22 settled with a warning letter.

23 CAPTAIN MISENCIK: Okay. You -- and one was  
24 settled and one wasn't?

1 THE WITNESS: Well, one is still open, sir.

2 CAPTAIN MISENCIK: I understand. Has Korean  
3 Air ever failed to respond to a letter of investigation  
4 initiated by your office?

5 THE WITNESS: No, sir. Not to my knowledge.

6 CAPTAIN MISENCIK: Does the State Department  
7 or any other government agency other than the FAA have  
8 any jurisdiction in enforcement actions against foreign  
9 carriers?

10 THE WITNESS: No, sir.

11 CAPTAIN MISENCIK: Has any government agency  
12 suggested leniency or that you take it easy in  
13 providing oversight to any of the foreign carriers?

14 THE WITNESS: To me, sir?

15 CAPTAIN MISENCIK: Yes.

16 THE WITNESS: No, sir.

17 CAPTAIN MISENCIK: Are you aware of -- of  
18 that situation happening to any other POI?

19 THE WITNESS: No, sir. I'm not aware of any  
20 such thing.

21 CAPTAIN MISENCIK: Uh huh. Well, I was just  
22 curious about your comment to me that indicated maybe  
23 there was something else, but --

24 THE WITNESS: Well, I'm -- I'm sure there's  
25 political pressure being applied to the top echelons of

1 the FAA, but what goes on up there I'm not aware of.  
2 But personally, nobody's tried to put any pressure on  
3 me.

4 CAPTAIN MISENCIK: Uh huh. How are you sure  
5 of that, Mr. Zeigler?

6 THE WITNESS: Well, I'm -- I'm assuming just  
7 a fact of life, politics being politics.

8 CAPTAIN MISENCIK: I understand. What were  
9 some of the examples of your findings with Korean Air  
10 in ramp inspections or other -- other oversight -- some  
11 of the discrepancies that you had uncovered?

12 THE WITNESS: Well, one of the problems that  
13 we find probably with every one of the foreign carriers  
14 is with the floor path escape lighting system. On  
15 arrival we'll usually find the whole series, maybe a  
16 whole section of the cabin where the lights are  
17 inoperative. And in generally speaking, they fix 'em  
18 before they leave because the MEL says that they cannot  
19 have more than two in a row out at any one time.  
20 That's one of the more common things that we find.

21 The other thing is occasionally we'll find  
22 pilots that either don't have their license or they  
23 don't have their medical certificates with them. Those  
24 are probably the three most common things that we find.

1 CAPTAIN MISENCIK: Is that pretty common  
2 among the -- the carriers you -- you oversee or was  
3 that --

4 THE WITNESS: Everybody.

5 CAPTAIN MISENCIK: So, was there anything  
6 that stood out in your mind about Korean Air as far as  
7 oversight -- your oversight of the airline compared to  
8 the other carriers you oversaw?

9 THE WITNESS: No, not that I can think of  
10 offhand.

11 CAPTAIN MISENCIK: As a result of the  
12 accident in -- in Guam, are you aware of any changes  
13 that have occurred in -- in their operations, Korean  
14 Air operations?

15 THE WITNESS: I'm not aware of any.

16 CAPTAIN MISENCIK: Are you aware of any  
17 changes or proposed changes that have occurred at the  
18 FAA as a result of -- in Part 129 operations a result  
19 of the Guam accident?

20 THE WITNESS: I'm not aware of any, sir.

21 CAPTAIN MISENCIK: Okay. As a -- an  
22 international geographic or -- I know it's not a  
23 correct term, but POI, what changes would you like to  
24 see that would make your job of oversight more  
25 efficient or --

1 THE WITNESS: Wel, I would like --

2 CAPTAIN MISENCIK: -- more safety-directed?

3 THE WITNESS: I would like to see FAR 129  
4 rewritten in a more thorough and complete manner at  
5 least similar to the way 121 is written.

6 I would like to see the new automated 129 op  
7 specs produced so we can start using 'em.

8 And I would like to see more thorough  
9 guidance in our handbooks and our orders for geographic  
10 international inspectors.

11 And one other thing that I would like to see  
12 corrected would be the addition of in -- in FAR 91 the  
13 addition of all of the articles of IKO and the annexes  
14 rather than the one place that it quotes in 91703 A2  
15 where it only refers to Annex 2. The other annexes,  
16 particularly Annex 6, are far more important. That's  
17 the heart of the operating parts of the annexes. And  
18 there are certain of the articles that are also  
19 extremely important.

20 CAPTAIN MISENCIK: Okay. Thank you, Mr.  
21 Zeigler. I don't have any other questions.

22 CHAIRMAN FRANCIS: KCAB?

23 MR. LEE: Thank you, Mr. Chairman. We have  
24 no questions. Thank you.

1 CHAIRMAN FRANCIS: Korean Air?

2 CAPT. KIM: No questions, sir. Thank you  
3 very much.

4 CHAIRMAN FRANCIS: Barton ATC?

5 MR. E. MONTGOMERY: No questions, Mr.  
6 Chairman.

7 CHAIRMAN FRANCIS: Boeing Company?

8 MR. DARCY: No questions, Mr. Chairman.

9 CHAIRMAN FRANCIS: Guam?

10 MR. DERVISH: No questions, Mr. Chairman.

11 CHAIRMAN FRANCIS: NATCA?

12 MR. MOTE: No questions, Mr. Chairman. Thank  
13 you.

14 CHAIRMAN FRANCIS: Mr. Donner, sir?

15 MR. DONNER: No questions, sir.

16 CHAIRMAN FRANCIS: Gerg?

17 MR. FEITH: Yes, sir. I do have some  
18 questions. And I am going to beg your pardon, Mr.  
19 Chairman. I know that you were talking about not  
20 having any redundant questions but I just want to make  
21 sure that I have the picture.

22 Mr. Zeigler, in brief terms, what do you do  
23 as a POI or as a -- international geographic inspector  
24 as far as oversight is concerned? I heard you say that  
25 you don't do en routes, you don't have to review

1 manuals, you don't approve training programs. You do  
2 take some sort of violation action when there is a  
3 violation that occurs. Given the number of airlines  
4 that you were overseeing, what is it in the broad sense  
5 that you focus in on to take corrective action on a 129  
6 operator?

7 THE WITNESS: Well, of course, the first  
8 thing that we do on all the carriers is try to maintain  
9 their op specs up-to-date. Whenever they make changes  
10 either in aircraft or places that they're -- they want  
11 to go, they're supposed to submit changes to us and we  
12 have to keep their op specs updated.

13 They're -- as I mentioned, the inspections  
14 that we do are set forth in our annual work program,  
15 and we are required by our annual work program, the  
16 NPG, to do a station facility inspection, a trip  
17 records inspection, a ramp inspection, and depending on  
18 the airport, a de-icing inspection if it's one of those  
19 that's located in the northern part of the country for  
20 each airport within the U.S. that that airline operates  
21 to.

22 MR. FEITH: Okay. Now, you -- and this is  
23 where I got confused because you told Captain Misencik  
24 that you don't get their manuals and the updates to  
25 their manuals, yet you -- you do track their op specs,

1     so you -- you're getting that on a recurrent basis to  
2     understand when the changes are coming down the line in  
3     their op specs, is that correct?

4             THE WITNESS: I don't follow you there.

5             MR. FEITH: You said that you don't -- you  
6     don't have any manuals from the carrier that you're  
7     responsible for.

8             THE WITNESS: That's correct.

9             MR. FEITH: But you do track the op specs and  
10    changes to their op specs.

11            THE WITNESS: We -- we maintain the op specs  
12    in our office.

13            MR. FEITH: Okay. With that in mind, how are  
14    these changes communicated?

15            THE WITNESS: Well, the airline if they wish  
16    to make any changes, such as adding an airport or  
17    taking an airport away or if they buy three new  
18    airplanes and they want to add those aircraft, they  
19    must let us know. They send a copy -- their blank op  
20    specs pages which we give to each airline, and they  
21    fill out these new pages and send them to us in  
22    duplicate. And we review it and we either approve it  
23    or maybe we find some mistakes and send it back to 'em.  
24    But in any case, once it's approved then it goes into  
25    their file.

1           MR. FEITH: Okay. Let me -- let me just  
2 digress a little bit because, again, I got confused  
3 with the communication. You said you don't communicate  
4 on a regular basis with your counterpart in the foreign  
5 government.

6           THE WITNESS: That's correct. These -- what  
7 we're talking about on op specs is back and forth  
8 between us and the airline.

9           MR. FEITH: Okay. Now, if there is a problem  
10 with the op spec, do you deal directly with the airline  
11 or you --

12          THE WITNESS: Yes, sir.

13          MR. FEITH: Okay.

14          THE WITNESS: With the airline.

15          MR. FEITH: And that resolution is directly  
16 with the airline. How about your counterpart? Is  
17 there ever an interface with your counterpart, your  
18 foreign counterpart in the --

19          THE WITNESS: No, sir.

20          MR. FEITH: Should there be?

21          THE WITNESS: Might not be a bad idea.

22          MR. FEITH: Do you have a -- an assistant POI  
23 that assists you? I -- I -- I see that you were  
24 responsible for one, two, three -- about eight airlines  
25 prior to your reassignment with the -- the current

1 carriers that you have, but at the time of the accident  
2 you had about eight airlines. Do you have an assistant  
3 that helps you with all of these airlines?

4 THE WITNESS: No, sir.

5 MR. FEITH: How much time do you spend with  
6 each of these carriers or overseeing each of these  
7 carriers?

8 THE WITNESS: With each one?

9 MR. FEITH: Uh huh.

10 THE WITNESS: An awful lot of time, believe  
11 me.

12 MR. FEITH: Is there enough time in your day  
13 to oversee all of these carriers?

14 THE WITNESS: Well, again, our -- our ramp  
15 inspection, our work program, all the inspections that  
16 we're required to do by our work program only take up  
17 supposedly a certain percentage of our time, so we do  
18 have other things to do. But we accomplish as a rule  
19 100 percent of our work program every year.

20 MR. FEITH: But you're only one person  
21 looking at nine different airlines.

22 THE WITNESS: Yes, sir. In some of these  
23 inspections at -- at other out-stations are done by  
24 other inspectors at -- at those stations. However, we  
25 try at our office to make an effort for each airline

1     that we're assigned to do an inspection at each and  
2     every facility that they come into. In the case of  
3     Korean Airlines, because they came into so many  
4     different places in the United States, there was just  
5     simply no way I was ever going to have time to go  
6     around to all of 'em.

7             MR. FEITH: Do you need a PO -- an assistant?

8             THE WITNESS: Do I need an assistant?

9             MR. FEITH: Yeah.

10            THE WITNESS: Well, it wouldn't be bad, but  
11     where our staffing level is, that's -- there's no way  
12     that's going to happen.

13            MR. FEITH: Do you think that because of that  
14     staffing level that there might be a compromise to the  
15     oversight of 129 operators into the United States?

16            THE WITNESS: I don't think so because,  
17     again, we have offices scattered throughout and -- and  
18     wherever the airline goes we can always call upon  
19     inspectors in those offices to go do these inspections  
20     for us.

21            (Pause)

22            MR. FEITH: If the chairman will allow me,  
23     I'll pass to the Board of Inquiry while I sort out the  
24     rest of my questions real quick.

1 CHAIRMAN FRANCIS: All right. Pat?

2 MR. CARISEO: I -- I have a couple questions.

3 Why are -- why are you no longer involved in  
4 inspecting Korean Airlines?

5 THE WITNESS: Well, as I said earlier, sir,  
6 we had a new inspector come into the office so we  
7 rearranged all the airlines. And what we were trying  
8 to do is instead of having so many different airlines  
9 in different countries, we tried to put them all with  
10 one -- you know, from one country with one inspector.  
11 And since we had this new inspector come in we just  
12 redivided all the airlines up. It had nothing to do  
13 with Korean being Korean or anything else. I just  
14 ended up with the three Chinese airlines and two  
15 Japanese airlines.

16 MR. CARISEO: Does this other inspector have  
17 a similar workload that you do?

18 THE WITNESS: Yes, sir. He does. All  
19 inspectors in our office do.

20 MR. CARISEO: You had mentioned that you  
21 would probably like an assistant. Is -- have you  
22 expressed your desire to your higher-ups that maybe you  
23 need some additional resources?

24 THE WITNESS: I think they're well aware that  
25 we need additional resources, sir.

1 MR. CARISEO: And what has their answer been?

2 THE WITNESS: They're trying to get the  
3 people, but --

4 MR. CARISEO: Thank you.

5 MR. BERMAN: Mr. Zeigler, you're the  
6 principal geographic inspector assigned to Korean Air?

7 THE WITNESS: ~~N~~t now. I was.

8 MR. BERMAN: You were, --

9 THE WITNESS: Yes.

10 MR. BERMAN: -- sorry.

11 As such, when you were doing that, did you  
12 receive any assistance from other geographic inspectors  
13 elsewhere in the United States?

14 THE WITNESS: Oh, yes, sir.

15 MR. BERMAN: How did they report their  
16 findings to you?

17 THE WITNESS: By either fax or through the  
18 PTRS system.

19 MR. BERMAN: How often did you review the  
20 PTRS findings from Korean Air?

21 THE WITNESS: Every time we had anything come  
22 into the office for any given airline it was delivered  
23 -- on the upload/download it was delivered to the  
24 inspector responsible.

1 MR. BERMAN: Have you ever had a finding from  
2 PTRS that was -- caused you to take further action?

3 THE WITNESS: Would you repeat that?

4 MR. BERMAN: Have you ever had a finding  
5 through the PTRS from another geographic inspector that  
6 caused you to take further action on Korean Air?

7 THE WITNESS: Yes, sir. At least one or two  
8 occasions I received PTRS reports from other inspectors  
9 and forwarded them both to the KCAB and the Korean  
10 Airlines.

11 MR. BERMAN: Was there ever a P -- a PTRS --

12 THE WITNESS: And -- and in -- in the case of  
13 Korean Airlines themselves, they did respond to me.

14 MR. BERMAN: Was there every any input from  
15 other geographic inspectors about non-compliance with  
16 clearances?

17 THE WITNESS: I don't -- I'm sorry. What?

18 MR. BERMAN: Was there ever any PTRS or other  
19 input from other parts of the country on Korean Air  
20 about non-compliance with air traffic control  
21 clearances?

22 THE WITNESS: Oh, with air traffic control?  
23 No, sir.

24 MR. BERMAN: Okay. Did you ever get out to  
25 Guam to inspect station or conduct ramp -- ramp

1 inspections?

2 THE WITNESS: Yes, sir.

3 MR. BERMAN: When was your last visit to  
4 Guam?

5 THE WITNESS: I was on Guam I believe it was  
6 in May or June of '97.

7 MR. BERMAN: Inspecting Korean Air?

8 THE WITNESS: Korean Air, Asiana, All Nipon,  
9 all the carriers that -- the foreign carriers that came  
10 in there.

11 MR. BERMAN: Did you observe flight  
12 operations --

13 THE WITNESS: Yes, sir.

14 MR. BERMAN: -- approaches and departures?

15 Does the FAA classify foreign air carriers as  
16 to their compliance with Federal regulations or as to  
17 their ability to operate in the United States?

18 THE WITNESS: Not that I'm aware of, sir.

19 MR. BERMAN: They don't classify them as  
20 class one, two, or three?

21 THE WITNESS: Not the airlines, no, sir.

22 MR. BERMAN: Do they classify the foreign --  
23 they classify the foreign civil aviation bureaus,  
24 that's right.

1 THE WITNESS: Yes, sir. ~~On~~ the assessment  
2 program.

3 MR. BERMAN: Did any of the carriers that you  
4 oversee or have overseen operate in countries that were  
5 classified below class one?

6 THE WITNESS: Yes, sir.

7 MR. BERMAN: When -- when you are in that  
8 situation, do you take any other or different actions  
9 as far as your oversight of that air carrier?

10 THE WITNESS: Well, on those that are from  
11 category two countries we do increase surveillance on  
12 them.

13 MR. BERMAN: What do you do?

14 THE WITNESS: More and more inspections, ~~more~~  
15 thorough inspections.

16 MR. BERMAN: What would be a more thorough  
17 inspection?

18 THE WITNESS: We try to get really nitpicking  
19 with them.

20 MR. BERMAN: Can you give me an example?

21 THE WITNESS: Well, on a ramp inspection  
22 normally the -- if you were to take the ramp inspection  
23 form, it calls to you to inspect a considerable number  
24 of items. Generally speaking, you do not have the time  
25 on any given ramp inspection to literally hit every one

1 of those items because usually the aircraft's only  
2 going to be there for an hour. And if you went through  
3 everything on there it might take two or three hours.

4 So, in the case of one of these that -- that  
5 we really wanted to take a hard look, we may end up  
6 delaying the departure in order to hit some of the  
7 other items that we wouldn't ordinarily do on a routine  
8 ramp.

9 MR. BERMAN: So you -- you do a more thorough  
10 ramp inspection, but do you ever get further into the  
11 manuals or the flight procedures of those airlines?

12 THE WITNESS: No, sir, because we don't have  
13 any -- any approval authority over the manuals.

14 MR. BERMAN: Have you ever grounded an  
15 airplane during one of your ramp inspections?

16 (Pause)

17 THE WITNESS: Temporarily, yes, sir.

18 MR. BERMAN: And have you ever grounded a  
19 Korean Air airplane?

20 THE WITNESS: No. No, sir.

21 MR. BERMAN: Okay. No further questions.

22 CHAIRMAN FRANCIS: Mr. Feith, are you --

23 MR. FEITH: I just have a couple --

24 CHAIRMAN FRANCIS: -- reorganized?

1 MR. FEITH: Yes, sir. I just have a few  
2 follow-up questions after listening to Mr. Zeigler.

3 As Mr. Berman was just asking about your ramp  
4 inspections and doing more thorough inspections and you  
5 had mentioned that you may in fact delay a flight or  
6 temporarily ground an airplane, are there any political  
7 ramifications if you in -- if you do delay a flight or  
8 ground an airplane?

9 THE WITNESS: Well, there could be, I  
10 suppose.

11 MR. FEITH: Have you ever --

12 THE WITNESS: Well, I --

13 MR. FEITH: -- felt those ramifications?

14 THE WITNESS: -- you know, the few delays  
15 that we've caused have been relatively minor. I'm  
16 talking a matter of an extra 15 to 30 minutes. And  
17 usually there are other things that are delaying their  
18 departure anyway.

19 MR. FEITH: So you don't --

20 THE WITNESS: Clearances or whatever.

21 MR. FEITH: So you don't get any feedback  
22 from above?

23 THE WITNESS: No, sir.

24 MR. FEITH: As far as corrective action on  
25 the PTRSs, you had said that on PTRS findings those

1 PTRS findings are submitted to the KCAB or to the other  
2 foreign authority and to the airline. How do you know  
3 if corrective action has been taken?

4 THE WITNESS: Well, when I sent a copy of it  
5 to the airline, I asked them to tell me what action  
6 they had taken, and then they responded and they told  
7 me what they had done.

8 MR. FEITH: What if the action isn't  
9 satisfactory to you?

10 THE WITNESS: Then we could write 'em another  
11 letter and -- and tell 'em that it wasn't satisfactory  
12 and we need that they do something else.

13 MR. FEITH: Do you ever have a problem with  
14 having corrective actions taken on PTRS findings --

15 THE WITNESS: No, sir.

16 MR. FEITH: -- that are made?

17 I have no further questions.

18 CHAIRMAN FRANCIS: Mr. Berman mentioned the  
19 assessment program and the categorization of -- of  
20 authorities worldwide. It's a program that's been  
21 going on now for six or seven years. It's a very  
22 important program. It's one that's expanding. IKO's  
23 taking over leadership of this program. And as -- as  
24 we can see here, there are some very serious  
25 constraints in terms of the 129 Program. Hopefully,

1     and I think already we're seeing the assessment program  
2     and the way that it's being run leading to -- to some  
3     serious and -- and significant improvements in -- in  
4     aviation safety around the world. So I -- I think that  
5     that's something that the FAA started a number of years  
6     ago and for which they deserve some credit. It's also  
7     very much helping to deal with some of the issues that  
8     we've talked about here today.

9             I believe that's the end of the day. We will  
10    reconvene here at 9:00 tomorrow morning. And enjoy  
11    your evening in Hawaii.

12            (Whereupon, the proceedings were adjourned,  
13    to reconvene at 9:00 a.m., Wednesday, March 25, 1998.)
